I. Introduction

I.1. The Commission has expressed a general policy in favour of promoting risk capital (1) in the Community. It has, for example, expressed concern about the risks of Community enterprises being overdependent on debt finance (2), and emphasised the potential for growth and job creation which an increase in risk capital markets would have (3). The Commission believes that certain types of enterprises, or enterprises at certain stages of their existence, may be better served by equity or near-equity finance than by loan finance alone, given the costs of servicing debt and the risk-averse nature of many lending institutions.

I.2. A commitment to risk capital was set out as a wider Community objective at the Lisbon European Council of 23-24 March 2000, which set the date of 2003 for implementation of the risk capital action plan (RCAP) and encouraged the redirection of funding towards support for business start-ups, high-tech firms and micro-enterprises, as well as other risk-capital initiatives proposed by the European Investment Bank (EIB).

I.3. An equity gap, implying that there is a persistent capital market imperfection preventing supply from meeting demand at a price acceptable to both sides, affects negatively European small and medium-sized enterprises (SMEs) compared with similar companies in North America. The gap concerns, on one hand, high-tech innovative and mostly young firms with high growth potential and, on the other hand, a wide range of firms of different ages and sectors with smaller growth potential that cannot find financing for their expansion projects without external risk capital.

I.4. The provision of equity finance, in particular to smaller businesses, presents numerous challenges both to the investor and to the enterprise. The investor needs to make a careful analysis not merely of any collateral being offered (as is the case of a lender) but of the entire business strategy. For the enterprise, there is the challenge of sharing control with an outside investor, possibly for the first time in its life.

I.5. Given the perceived advantages of an increase in risk capital provision, and also recognising the challenges for economic operators in undertaking risk capital as an activity, public authorities have sought to take measures to promote risk capital markets. The Commission has identified several measures, in particular in the RCAP, which should be taken to encourage the growth of risk capital markets. These include:

(a) promoting a culture of entrepreneurship;

(b) easing fiscal constraints on equity, such as less favourable treatment than that given to debt financing;

(c) measures to foster market integration;

(d) easing regulatory constraints, including limitations on investments by certain types of financial institutions (e.g. pension funds) and administrative procedures for setting up companies.

I.6. The Commission has made it clear that the philosophy underlying the strategy for developing the Community risk capital market attaches primary importance to the creation of an environment favourable to creating and sustaining new and innovative businesses, through structural and horizontal measures such as those shown above (4). This reflects the fact that risk capital provision is essentially a commercial activity involving commercial decisions. Economic and budgetary conditions are such that public funds on their own will not be able, and should not attempt, to provide the whole of the increase in risk capital activity which the Community seeks. The key challenge is to provide the conditions under which the large reserves of private capital which exist in Europe will be used for such investment. This challenge concerns as much the development of the demand for capital by entrepreneurs as the supply of capital by investors.

17. In addition, however, the Commission has recognised ‘a role for public funding of risk capital measures limited to addressing identifiable market failures’ (5). Public authorities at national level have used public capital to support

---

(1) The Commission defined risk capital in its 1998 paper ‘Risk capital: a key to job creation in the European Union’ (SEC(1998) 552 final, 31 March 1998) as equity financing to companies in their start-up and development phases, and the phrase is used with that sense in the present document. The term ‘venture capital’ refers essentially to risk capital provided by investment funds (venture capital funds) established for that purpose. Such funds often provide a mix of equity, mezzanine and subordinated loan finance and the term ‘venture capital’ refers to the totality of this finance.

various schemes for increasing the supply of risk capital. The Commission itself has proposed, and the Council has agreed, that in regions eligible for intervention by the Structural Funds, such intervention may take the form of co-financing of risk capital funds for SMEs, consistent with the State aid rules. The Commission believes that the replacement of grant finance by risk capital (and also loan funding) allows the structural funds to reach a larger number of beneficiaries, with a lower cost per job created, and thus to be more cost-efficient.

I.8. Such measures inevitably raise the question of compatibility with the State aid Articles of the Treaty (5).

II. Aim and scope of this document and relation to other texts

II.1. This document has two principal aims:

(a) to set out how the Commission will apply the State aid definition in Article 87(1) of the EC Treaty to measures designed to provide or promote risk capital ('risk capital measures');

(b) to provide new criteria under which the Commission may authorise such measures which do constitute State aid, even if they are not compatible with the other guidelines, frameworks or regulations which the Commission has adopted.

II.2. In addition the document aims to explain why State aid control in this area is necessary, to explain the difficulties in applying current guidelines to such measures, and to justify why the Commission considers that the new compatibility criteria are both necessary and appropriate.

II.3. Nothing in this document should be taken to call into question the compatibility of State aid measures which meet the criteria of any other guidelines, frameworks or regulations adopted by the Commission.

II.4. This document in no way derogates from the provisions of the Community guidelines on State aid for rescuing and restructuring firms in difficulty (6).

II.5. The Commission will pay particular attention to the need to prevent the use of this communication to circumvent the principles laid down in existing frameworks and guidelines.

III. Reasons for controlling public funding to risk capital measures

III.1. Aside from the fact that the Treaty imposes on the Commission the requirement to control State aid within the Community, and in common with other forms of public intervention, national and Community authorities, when deciding whether to commit or to authorise public funds for measures designed to promote risk capital, should reduce as far as possible the following three distinct though connected categories of risk:

(a) The risk that advantages to the beneficiaries (whether investors or enterprises) create an undue distortion of competition relative to their competitors in the internal market.

(b) The risk of ‘dead-weight’, or lack of incentive effect. Some enterprises funded through publicly supported measures may have obtained finance on the same terms in any case. There is evidence of this happening though this is inevitably anecdotal. In that event public resources are being used unnecessarily.

(c) The risk of ‘crowding out’. The presence of publicly supported measures may actually discourage other potential investors from providing capital.

III.2. Not all public measures carried out in favour of risk capital schemes fall within the definition of State aid in Article 87(1) of the Treaty and therefore under the Commission’s State aid control. The next section of this document therefore provides guidance as to how the Commission interprets the definition of State aid as it concerns risk capital measures.

(5) While the State aid articles of the Treaty only apply to national (or sub-national) measures, a coherent policy requires that measures taken at a Community level should not conflict with State aid rules.

IV. Applicability of Article 87(1) to risk capital measures

IV.1. In the case of a measure in the form of a grant or loan, it is normally obvious which enterprise is potentially the beneficiary for the purpose of assessing whether State aid is involved. However, certain constructions devised to promote risk capital are more complex because the public authorities create incentives for one set of economic operators (investors) in order to provide finance to another set (for example, smaller enterprises). Depending on the design of the measure, and even if the intention of the public authorities may be only to provide benefits to the latter group (7), enterprises at either or both ‘levels’ may be beneficiaries of State aid. Moreover, in some cases the measure provides for the creation of a fund or other investment vehicle which has an existence separate from investors and the enterprises invested in. In such cases it is also necessary to consider whether the fund or vehicle can be considered to be an enterprise benefiting from State aid.

IV.2. When assessing risk capital measures the Commission will therefore have to consider the possibility that the measure may confer aid on at least three different levels:

(i) aid to investors;

(ii) aid to any fund or other vehicle through which the measure operates (in the case of a ‘fund of funds’ there may be more than one such level);

(iii) aid to the companies invested in.

IV.3. In order for a measure to fall within the scope of Article 87(1) of the Treaty, four cumulative criteria must be met:

(i) the measure must involve the use of State resources; in the case of the direct financial participation of public authorities in risk capital measures, or tax incentives for investors, this is usually self-evident;

(ii) the measure must distort competition by conferring an advantage on the beneficiary; in accordance with the case law of the Court, the Commission must assume that State aid is likely to be present whenever State resources are contributed in a manner which would not be acceptable to a private investor operating under normal market economy conditions. Where by contrast the public authorities invest on terms that would be acceptable to such an investor, no advantage is conferred and there is therefore no State aid (8). It follows that where State resources are made available on the same terms as those applying to private investors (pari passu) it will normally be possible to conclude that the measure does not confer an advantage. However, if the State resources are made available on more favourable terms, then an advantage will normally be present;

(iii) that advantage must be selective, in that it is limited to certain undertakings; if a measure applies without limitation or sectoral or geographical distinction to all enterprises throughout the territory of a Member State, then it is not selective (9). However, any measure which, because of its nature, can only apply to a limited number of enterprises, is selective. Likewise, a measure is selective if it provides for investments to be made only in certain enterprises, for example limited by sector or by region. It should be noted that a measure which is general as regards investors (that is, it is available to all investors) may nonetheless be selective at the level of companies invested in (10);

(iv) the measure must affect trade between Member States. Since investment of capital is an activity which is the subject of very large trade between Member States, and since any measure providing an advantage to investors has the declared aim of affecting their investment decisions, the Commission will normally consider that this criterion is met by risk capital measures in favour of investors. In assessing any effect on trade, the Commission needs to consider the effects across capital markets more generally, not merely on investors who may or may not have been previously operating in the market for providing equity capital to the enterprises targeted by the measure. Similarly, unless it can be shown that all investments will be made in enterprises engaged in activities which are not the subject of trade between Member States, the Commission will regard this criterion as met at all the levels for which the other criteria are fulfilled (11).

(7) The Court of Justice of the European Communities has held that Article 87 does not distinguish between the measures of State intervention concerned by reference to their causes or aims but defines them in relation to their effects. Italy v Commission, Case 173-73 [1974] ECR 709.

(9) This could be the case, for example, of a tax measure promoting investment in a certain class of financial instrument.

(10) See for example the Court judgment of 19 September 2000 in Case C-156/98, Germany v Commission (not yet published).

(11) In this connection the Court of Justice has held that: ‘in the case of an aid programme the Commission may confine itself to examining the characteristics of the programme in question in order to determine whether, by reasons of the high amounts or percentages of aid, the nature of the investments for which aid is granted or other terms of the programme, it gives an appreciable advantage to recipients in relation to their competitors and is likely to benefit undertakings engaged in trade between Member States’ Case 248/84, Germany v Commission [1987] ECR 4013, at paragraph 18 (emphasis added).
IV.4. There are already a number of published Commission texts which provide interpretation on whether individual measures fall within the definition of State aid and which may be relevant to risk capital measures. These include the 1984 communication on government capital injections (12), the 1998 notice on the application of the State aid rules to measures relating to direct business taxation (13) and the notice on the application of Articles 87 and 88 of the EC Treaty to State aid in the form of guarantees (14). The Commission will continue to apply these texts when assessing whether risk capital measures constitute State aid.

IV.5. In accordance with the principles set out above, the Commission will take the following factors into account in determining whether State aid is present at each of the different levels.

(1) AID TO INVESTORS

Where a measure allows investors to participate in the equity of a company or set of companies on terms more favourable than public investors, or than if they had undertaken such investments in the absence of the measure, then those investors receive an advantage (15). This remains the case even if the investor is persuaded by the measure to confer an advantage on the company or companies concerned. The fact that owing to the existence of a market failure no investors would otherwise make such investments, is not of itself sufficient to rebut the presumption of advantage. In effect, the investors are being offered more advantageous terms to compensate them for the factors which cause market failure, and the Commission considers that such compensation must be considered as an advantage, which will constitute aid if the investors are enterprises and if the other conditions described above, notably selectivity, are met. Provided, however, that the advantage is limited to the amount necessary to overcome the factors which cause market failure, it may be considered compatible with the Treaty, where it meets the principles described in section VIII below, because of its limited effect.

(2) AID TO AN INTERMEDIATE VEHICLE OR FUND

In general, the Commission would tend to the view that a fund is a vehicle for the transfer of aid to investors and/or enterprises invested in, rather than being an aid beneficiary itself. However, in certain cases, notably measures involving transfers in favour of existing funds with numerous and diverse investors, the fund may have the character of an independent enterprise. In that case aid will usually be present unless the investment is made on terms which would be acceptable to a normal economic operator in a market economy and therefore provides no advantage to the beneficiary.

(3) AID TO THE ENTERPRISES INVESTED IN

Once again the main test is whether the enterprise has received the investment on terms which would be acceptable to a private investor in a market economy. This test can, as an example, be met when the investment made through the risk capital measures is made pari passu with such an investor or investors. Where this is not the case, the fact that investment decisions are being taken by commercial managers of risk capital funds, or by representatives of investors, with an interest to ensure a maximum return for the fund is an important indicator, but it is not of itself conclusive. The Commission must also take into account the possibility that any advantages accorded to investors in the funds are passed on to the enterprises invested in, when the investments are not made by the fund pari passu with a private investor in a market economy. If a risk capital measure has reduced the risks and/or increased the rewards which investors will obtain from making a particular investment, then they may be said no longer to be operating as a normal economic operator (15).

IV.6. Whether a measure provides aid, and at what level, will depend on its design. The Commission has experience of measures where it has found the measure is a general measure at the level of investors but provides State aid at the level of individual enterprises (17), of measures which provide State aid to investors but not to the enterprises invested in, through application of the pari passu principle described above (16), and of measures which could provide State aid at more than one level (18).

IV.7. Where all aid provided to beneficiaries is de minimis within the meaning of Commission Regulation (EC) No 69/2001 of 12 January 2001 on the application of Articles 87 and 88 of the EC Treaty to de minimis aid (19), then it is deemed not to meet all the criteria of Article 87(1) of the Treaty. In risk capital measures the

(14) OJ C 71, of 31.3.2000, p. 14. It should, however, be noted that guarantees granted by the State in favour of investments in risk capital are more likely to include an element of aid to the investor than is the case with traditional loan guarantees, which are normally considered to constitute aid to the borrower rather than to the lender.
(15) This may be the case of measures providing finance to investors for investment in such participations, where this provision is made on conditions more favourable than market terms.
(16) For example, Commission Decision 98/476/EC (OJ L 212, 30.7.1998, p. 30). This case was the subject of the Court judgment in Case C-156/98 referred to in footnote 10.
(17) See footnote 16.
(18) For example, Decision in Case N 705/99, United Kingdom High Technology Fund.
V. Assessment of the compatibility of risk capital measures under the State aid rules: application of existing texts

V.1. Where measures constitute State aid, the Commission is called to assess whether they can be found compatible with the common market under Article 87(2) and (3). Most risk capital measures could be found to be compatible only under paragraph 3(a) (for measures applying solely in regions eligible for the derogation in that paragraph), paragraph 3(c), or paragraph (d).

V.2. The immediate objectives of risk capital measures are likely to include the promotion of SMEs, in particular new or innovative firms, or firms with high growth potential, and/or the promotion of the development of a particular region. The Commission has already adopted texts under which State aid with such objectives can be authorised under paragraphs 87(3)(a) or (c) (21). The public authority devising the measure may also have the objective of encouraging more investors to become involved in the provision of this type of finance. No text on State aid in this area exists, and indeed it has not been explicitly recognised up to now as a Community objective capable in itself of justifying State aid (22). However, this does not in any way preclude the compatibility of a measure which meets the terms of other frameworks or guidelines.

V.3. One characteristic of existing frameworks or guidelines authorising State aid under paragraphs 87(3)(a) or (c) is that aid is authorised up to a level representing a ‘grant equivalent’ of a fixed percentage of certain of the beneficiary enterprise’s costs. These ‘eligible costs’ are principally fixed investments in land, buildings, new productive equipment and intangible assets (patents, know-how etc) labour costs linked to fixed asset investment, and the costs of consultancy services. Experience has shown, however, that risk capital measures can frequently not be found compatible under these rules, for some or all of the following reasons:

(a) The difficulty of establishing a ‘grant equivalent’ of equity capital. While the Commission has established rules for determining such equivalents for loans and guarantees (23), it has no such formula for equity capital. Against that, the Commission believes that a technical difficulty of calculation cannot of itself suffice to make a measure incompatible with the common market. It is examining the options for a possible methodology in this respect, and in the meantime will be open to proposed calculation methods accompanying notifications of risk capital measures (24).

(b) The difficulty of establishing a link with eligible costs, in particular under measures which provide incentives to investors, and notably under measures in the form of funds. Such a link is not easily reconcilable with the commercial fund management which will be required by investors participating in funds and may raise verification and enforcement difficulties.

(c) For measures providing aid at the level of investors, the fact that no current text provides any basis for authorising such aid.

V.4. The Commission believes that in general there are good reasons for the ‘eligible costs’ approach. The approach provides certainty, predictability and a basis for limiting aid and for ensuring equal treatment between regions and Member States. It has served the Community well in the past and is likely to be the basis of most State aid control in the future. The Commission believes that good reasons are needed for departing from it.

V.5. In particular, the risk of departing from the principle is that State aid may be authorised which is merely ‘operating aid’, that is, aid to cover normal current expenses of a business. The Commission believes that such aid, which may isolate the beneficiary from the effects of commercial non-viability, is among the most distortive types of State aid and is authorised only in limited circumstances.

(22) The fact that an objective is recognised at Community level to be desirable does not, in itself, suffice to justify State aid proposed in its pursuit. It should be noted that the conclusions of the Lisbon European Council called for State aid reduction as well as an increase in risk capital.

V.6. However, the Commission also believes that the fact that risk capital measures cannot be found compatible on the basis of existing guidelines, and in particular the difficulties listed above, are not in themselves a justification for finding the measures incompatible with the common market. In certain decisions it has already taken, therefore, the Commission has had to consider whether, and on the basis of what criteria, it might be prepared to authorise them. With regard to the difficulties listed in the paragraphs above it has noted that:

(a) the costs regarded as eligible under existing frameworks are of less importance to many young or innovative enterprises. In any case, such costs will more often be capable of being financed by loan capital; the need for equity capital is generally linked not only to assets but also to the need for working capital during an enterprise's start-up or expansion phase;

(b) the lack of a link to eligible costs as defined in current texts is not necessarily evidence of operating aid, understood as aid which defrays an enterprise's normal operating expenses, and has no effect other than to keep it running. Aid with a clear incentive effect to an enterprise's start-up or expansion cannot be held to constitute operating aid in this sense, and could therefore be accepted under certain circumstances;

(c) as regards aid to investors, a measure cannot be considered incompatible solely because, by involving private sector or market investors, it constitutes a State aid to them as well as to the enterprises invested in. In general, where a transfer made by the State would be compatible with the State aid rules, the Commission believes that a measure which provides a minimum incentive to other economic operators to make that same transfer should also be authorised, even if technically an aid to those operators is involved.

VI. Basis for authorising risk capital measures under Article 87(3)(a), (c) and (d) of the Treaty

VI.1. The principal basis on which the Commission may authorise risk capital measures even though they fall outside the scope of existing rules is that one of the main handicaps suffered by SMEs, and in particular small enterprises and start-ups, is the difficulty in obtaining capital and credit. The chief causes of this are imperfect information, the risk-averse nature of investors and lending institutions and the limited guarantees that SMEs are in a position to offer (25). A particular obstacle to the provision of equity capital can be the high transaction and ‘due diligence’ costs relative to the amount of capital being provided.

VI.2. As was stated above (I.7), the Commission has recognised ‘a role for public funding of risk capital measures limited to addressing identifiable market failures’. A market failure can be defined as a situation in which economic efficiency is not achieved owing to imperfections in the market mechanism. A market failure may manifest itself either in the inability of the system to produce goods which are wanted (in this case a risk capital market), or by a misallocation of resources, which could be improved in such a way that some consumers would be better off and none worse off. The externalities involved in training and research and development activity result in a market failure which justifies State aid in those areas.

VI.3. As economic theory predicts that markets will usually fail in some sense except under conditions of perfect competition, the term market failure is reserved for cases where it is believed that a serious misallocation of resources has occurred. There are two main sources of market failure relevant to risk capital markets which particularly affect access to capital by SMEs and companies at the early stages of their development and which may justify public intervention:

(a) imperfect or asymmetric information: potential investors face more difficulties in gathering reliable information on the business prospects of an SME or a new company. Particularly if these are involved in highly innovative projects or risky projects, imperfect information will aggravate problems related to difficulties in the assessment of risk;

(b) transaction costs: small deals are less attractive to investment funds due to relatively high costs for investment appraisal and other transaction costs.

VI.4. The Commission believes that these factors can cause a market failure which would justify State aid. However, caution is needed. The fact that requests for finance, both debt and equity, have been turned down is not in itself an indication of market failure. Indeed, the Commission believes that there is no general risk capital market failure in the Community (26). It does, however, accept that there are market gaps for some types of investments, at certain stages of enterprises' lives and possibly for certain activities covered by Article 87(3)(d). It also recognises that there are particular difficulties in regions qualifying for assistance under Articles 87(3)(a) and (c) (assisted areas). These gaps and difficulties are to some extent already recognised in existing State aid frameworks, and where these can be applied to risk capital measures the Commission will be prepared to continue to do so.

VI.5. The Commission will therefore require provision of evidence of market failure before being prepared to authorise risk capital measures which fall outside the scope of existing rules. It may however be prepared to accept this is the case where each tranche of finance for an enterprise from risk capital measures which are in turn wholly or partially financed through State aid will contain a maximum of EUR 500 000, or EUR 750 000 in regions qualifying for assistance under Article 87(3)(c) or EUR 1 million in regions qualifying for assistance under Article 87(3)(a) (27). This is because for small transactions the argument that market failure exists due to high transaction costs is more persuasive. The fact that a market failure is recognised does not however alter the aid character of a particular measure, nor the need to assess its compatibility, in particular under the provisions of section VIII.

VI.6. Where it is recognised that there is a market failure, the Commission will examine whether any State aid measure is proportionate to the presumed market failure it is devised to meet, and will seek to ensure that any distortion is minimised. It believes that this can best be achieved by measures which are just sufficient to ensure that market investors provide capital and which result in investment decisions being taken on a commercial basis and on terms as close as possible to those which would prevail in the normal economy.

VI.7. The diversity of possible models for risk capital measures, and the relative novelty of some of the constructions being devised by Member States, mean that the Commission is not in a position to define rigid criteria by which to determine whether to authorise such measures. It has, however, identified certain elements which it will regard as positive, and others which it will regard as negative, in their assessment. These are set out in section VIII. The fact that the criteria are devised in this way reinforces the importance of all risk capital measures which constitute or which may constitute State aid being notified to the Commission under Article 88(3) of the EC Treaty before being put into effect, unless they are exempted from notification through a regulation such as that cited at IV.7 (28). Where the Commission is in possession of a complete notification which shows that a measure contains numerous positive elements, and no negative elements, the Commission will aim to make a rapid assessment of it within the deadlines laid down in Council Regulation (EC) No 659/1999 of 22 March 1999 laying down detailed rules for the application of Article 93 of the EC Treaty (29). It is proportionate to the presumed market failure it is devised to meet, and will seek to ensure that any distortion is minimised. It believes that this can best be achieved by measures which are just sufficient to ensure that market investors provide capital and which result in investment decisions being taken on a commercial basis and on terms as close as possible to those which would prevail in the normal economy.

VI.7. The diversity of possible models for risk capital measures, and the relative novelty of some of the constructions being devised by Member States, mean that the Commission is not in a position to define rigid criteria by which to determine whether to authorise such measures. It has, however, identified certain elements which it will regard as positive, and others which it will regard as negative, in their assessment. These are set out in section VIII. The fact that the criteria are devised in this way reinforces the importance of all risk capital measures which constitute or which may constitute State aid being notified to the Commission under Article 88(3) of the EC Treaty before being put into effect, unless they are exempted from notification through a regulation such as that cited at IV.7 (28). Where the Commission is in possession of a complete notification which shows that a measure contains numerous positive elements, and no negative elements, the Commission will aim to make a rapid assessment of it within the deadlines laid down in Council Regulation (EC) No 659/1999 of 22 March 1999 laying down detailed rules for the application of Article 93 of the EC Treaty (29).

(27) Separate injections of capital within six months of each other would be considered to be part of the same tranche, as would different injections, even over a longer period, to which a commitment is made as part of a single transaction.

VII. Form of the aid measure

VII.1. The Commission believes that the choice of form of an aid measure lies in general with the Member State. This applies equally to risk capital measures. However, and as further explained at section VIII, the Commission’s assessment of such measures will include whether they encourage market investors to provide risk capital to the ‘target enterprises’ and are likely to result in decisions to invest being taken on a commercial (that is, a profit-maximising) basis. The Commission believes that forms of incentives to such investors capable of producing this result, and therefore of being viewed positively under the criteria set out in section VIII below where they constitute State aid, include the following:

(a) Constitution of investment funds (‘venture capital funds’) in which the State is a partner, investor or participant, even if on less advantageous terms than other investors.

(b) Grants to venture capital funds to cover part of their administrative and management costs.

(c) Other financial instruments in favour of risk capital investors or of venture capital funds to provide extra capital for investment.

(d) Guarantees to risk capital investors or to venture capital funds against a proportion of investment losses, or guarantees given in respect of loans to investors/funds for investment in risk capital (30).

(e) Fiscal incentives to investors to undertake risk capital investment.

VII.2. The Commission does not intend to use the criteria in the following section to authorise measures which may provide capital to an enterprise solely in the form of loans (including subordinated loans and ‘equity loans’) or other instruments which provide the investor/lender with a fixed minimum return, whether through funds or through other means. Such capital provision is not ‘risk capital’ in the sense of the definition in footnote 1, and the Commission regards existing rules, covering notably the calculation of any aid element and the link to eligible costs, as adequate to assess such measures.

(30) The second alternative is one means of intervention of the US Small Business Administration in favour of small business investment companies.
VII.3. The Commission does not intend to use the criteria in the following section to authorise an ad-hoc measure providing capital to an individual enterprise.

VIII. Criteria for assessing compatibility

VIII.1. As was already explained in section VI, the criteria are expressed in the form of ‘positive and negative elements’. Not all the elements have equal weight, and in the following list the most important elements are listed first. No single element is essential, nor can any set of them be regarded as sufficient on its own to ensure compatibility. In some cases their applicability, and the weight attached to them, may depend on the form of the measure. The Commission’s assessment will take account of the regional specificity of any measure and will be subject to an overall test of proportionality.

Measures will be assessed at each level. In cases where the provision of risk capital to an enterprise is linked to costs which are eligible for aid under an existing framework or guideline, that text may be applied as an alternative to the principles below for assessing the aid to that enterprise, in line with paragraphs II.3 and V.2 above. Where the measure concerned also provides aid at the level of investors, however, such aid will still need to be assessed in accordance with the principles below.

VIII.2. Where the ceilings for transaction sizes set out in VI.5 are met, and when only investors (or an investment vehicle) are beneficiaries of State aid under the measure, such State aid is compatible to the extent that it is proportional to the cost disadvantages addressed, such as the higher relative costs of analysis and management of small investments. The provisions of VIII.3 below will be used to assess whether this is so.

The Commission will require provision of evidence of market failure where the ceilings for transaction sizes set out in paragraph VI.5 are exceeded.

VIII.3. Once market failure has been established, the Commission will examine the following elements in the assessment of a risk capital measure under the State aid provisions of the Treaty:

Restriction of investments, or failing that of a majority of funds invested:

(i) to small \(^{1}\) or even micro enterprises; and/or

(ii) to medium-sized enterprises in their start-up or other early stages \(^{2}\) or in assisted areas;

will be regarded as a positive element. Access to finance for medium-sized enterprises beyond their start-up or early stages should be subject to a limit per enterprise on total funding through the measure.

Restriction to smaller transaction sizes (that is to say, below EUR 500 000 or EUR 750 000 in regions qualifying for assistance under Article 87(3)(c) or EUR 1 million in regions qualifying for assistance under Article 87(3)(a)) or to a given level of demonstrated market failure will also be regarded as a positive element.

Decisions to invest should be profit-driven. A link between investment performance and the remuneration of those responsible for investment decisions will be a positive element. This would be assumed to be met:

(i) by measures under which all the capital invested in the target enterprises is provided by market economy investors, who also make the investment decision, with the aid being solely an incentive for them to do so; and

(ii) by other measures with significant involvement of market economy investors’ capital, being invested on a commercial basis (that is, only for profit) directly or indirectly \(^{3}\) in the equity of the ‘target enterprises’.

\(^{1}\) The European Venture Capital Association defines start-up financing as ‘financing provided to companies for product development and initial marketing. Companies may be in the process of being set up or may have been in business for a short time, but have not sold their product commercially’, and other early-stage as ‘financing to companies still in the stages of research and product development or that have completed the product development stage and require further funds to initiate commercial manufacturing and sales. They will not yet be generating a profit’.

\(^{2}\) ‘Indirectly’ should be taken to mean investment via funds or other investment vehicles.

In the case of funds, and while each measure will be regarded on its merits and other aspects will have a bearing on the Commission’s assessment, provision of at least 50% of the fund’s capital would be taken to constitute ‘significant involvement’, or 30% in the case of measures operating in assisted areas. Further positive elements would be:

(i) an agreement between a professional fund manager and participants in the fund, providing that the manager’s remuneration is linked to performance and setting out the objectives of the fund and proposed timing of investments;

(ii) the representation of market investors in decision-making; and

(iii) the application of best practice and regulatory supervision in the management of funds.

Where no such element is present to indicate that investment decisions will be commercially driven, then this will be regarded negatively. This will be taken to be the case of measures which are so small in size as to be focussed on only a few projects, and which are not economically viable, or of measures set up solely or principally to provide finance to a particular enterprise known in advance.

The level of distortion of competition between investors and between investment funds should be minimised. The Commission will regard positively a call for tender for the establishment of any ‘preferential terms’ given to investors, or the availability of any such terms to other investors. This availability might take the form of a public invitation to investors at the launch of an investment fund, or might take the form of a scheme (such as a guarantee scheme) which remained open to new entrants over an extended period. The means by which this positive element could be achieved will necessarily depend on the form of the measure in question. However the absence of any such check against overcompensation to investors, or a measure where the risk of losses is borne entirely by the public sector and/or where the benefits flow entirely to the other investors will be considered as a negative element.

Sectoral focus. To the extent that many private sector funds focus on specific innovative technologies or even sectors (such as health, information technology, culture) the Commission can accept a sectoral focus where this has a commercial as well as a public policy logic. In line, however, with the Commission’s consistently less favourable view of sectoral State aid measures, in particular in sensitive sectors suffering from overcapacity, measures should specifically exclude the provision of aid to enterprises in the shipbuilding and ECSC sectors.

Investment on the basis of business plans. The existence for each investment of a business plan containing details of product, sales and profitability development and establishing the ex ante viability of the project is standard commercial practice in professional fund management and will be positively regarded. Measures providing no ‘exit mechanism’ for the State’s direct or indirect involvement in individual enterprises would be regarded negatively.

Avoidance of cumulation of aid measures to a single enterprise. If a measure provides aid to the enterprises invested in, then the Commission may request commitments from a Member State to assess and set limits to other forms of State aid to enterprises funded by the risk capital measure, including under authorised schemes. For such measures, and unless the Member State undertakes that these enterprises will receive no other State aid other than de minimis aid, the Member State should propose to the Commission for examination and approval a reasonable evaluation of the aid element of the measure which will be used for applying the cumulation rules. Where capital provided to an enterprise under such a risk capital measure is used to finance initial investment, research and development costs or other costs eligible for aid under other frameworks, the Member State should include the aid element in the risk capital measure in applying the relevant aid ceilings.

IX. Final observations

The Commission intends to apply the terms of this communication for five years. However, given that the approach of this communication represents a departure from previous methods of State aid control, and that it deals with an area of rapid development in the Community economy, it reserves the right to adjust its approach in the light of experience. Where this would be helpful it may also provide further clarifications of its approach to particular issues.
