(ACTS WHEREOF PUBLICATION IS NOT OBLIGATORY)

COUNCIL

COUNCIL DIRECTIVE 92/40/EEC
of 19 May 1992
introducing Community measures for the control of avian influenza

THE COUNCIL OF THE EUROPEAN COMMUNITIES,

Having regard to the Treaty establishing the European Economic Community, and in particular Article 43 thereof,

Having regard to the proposal from the Commission (1),

Having regard to the opinion of the European Parliament (2),

Having regard to the opinion of the Economic and Social Committee (3),

Whereas poultry is listed in Annex II of the Treaty; whereas the marketing of poultry constitutes an important source of revenue for the agricultural population;

Whereas, it is necessary to establish at Community level the control measures to be taken in the event of outbreak of the highly pathogenic form of avian influenza, caused by an influenza virus with specific characteristics, and hereinafter termed avian influenza, in order to ensure national development of the poultry sector and contribute to the protection of animal health in the Community;

Whereas an outbreak of avian influenza can quickly take on epizootic proportions, causing mortality and disturbances on a scale liable to reduce sharply the profitability of farming or poultry as a whole;

Whereas action must be taken as soon as the presence of the disease is suspected so that immediate and effective control measures can be implemented when its presence is confirmed;

Whereas it is necessary to prevent any spread of the disease as soon as an outbreak occurs, by carefully monitoring movements of animals and the use of products liable to be contaminated, and where appropriate, by vaccination;

Whereas diagnosis of the disease must be carried out under the auspices of responsible national laboratories, the coordination of which must be ensured by the Community reference laboratory;

Whereas common measures for the control of avian influenza form a basis for maintaining a unified standard with relation to animal health;

Whereas Article 3 of Council Decision 90/424/EEC of 26 June 1990 on expenditure in the veterinary field (4) applies in the event of the occurrence of avian influenza;

Whereas it is appropriate to confer upon the Commission the task of taking the necessary applicatory measures,

HAS ADOPTED THIS DIRECTIVE:

Article 1

This Directive defines the Community control measures to be applied in the event of an outbreak of avian influenza in poultry without prejudice to the Community provisions governing intra-Community trade.

This Directive shall not apply where avian influenza is detected in other birds; however, in this case, the Member State concerned shall inform the Commission of any measure it takes.

Article 2

For the purpose of this Directive, the definitions given in Article 2 of Council Directive 90/539/EEC of 15 October 1990 on animal health conditions governing

intra-Community trade in, and imports from third countries of, poultry and hatching eggs (1) shall apply as appropriate.

The following definitions shall also apply:

(a) *infected poultry* shall mean any poultry:
   — in which the presence of avian influenza, within the meaning of Annex I, has been officially confirmed following an examination by an approved laboratory, or
   — in the case of second and subsequent outbreaks, in which clinical signs or post-mortem lesions consistent with avian influenza are present;

(b) *poultry suspected of being infected* shall mean any poultry showing clinical signs or post-mortem lesions which are such that the presence of avian influenza may reasonably be suspected or any poultry in which the presence of influenza A virus of subtype H5 or H7 has been demonstrated;

(c) *poultry suspected of being contaminated* shall mean any poultry which may have been directly or indirectly exposed to the avian influenza virus, or influenza A virus of H5 subtype or H7 subtype;

(d) *competent authority* shall mean the competent authority within the meaning of Article 2 (6) of Directive 90/425/EEC (7);

(e) *official veterinarian* shall mean the veterinarian designated by the competent authority.

**Article 3**

Member States shall ensure that there is compulsory and immediate notification of the suspected presence of avian influenza to the competent authority.

**Article 4**

1. When poultry in a holding are suspected of being infected or contaminated with avian influenza, Member States shall ensure that the official veterinarian immediately activates official investigation arrangements to confirm or rule out the presence of the disease and, in particular, must take or have taken the samples necessary for laboratory examination.

2. As soon as the suspected infection is notified, the competent authority shall have the holding placed under official surveillance and shall in particular require that:

   (a) a record be made of all categories of poultry on the holding showing in respect of each of the categories the numbers of poultry which have died, which show clinical signs, and which show no signs. The record shall be kept up-to-date to include birds born or dying during the period in which there is a suspicion. The data in the record shall be kept up-to-date and be produced on request, and may be checked at each visit;

   (b) all poultry on the holding are kept in their living quarters or confined in some other place where they can be isolated and without contact with other poultry;

   (c) no poultry enter or leave the holding;

   (d) all movement

   — of persons, other animals and vehicles to or from the holding,

   — of poultry meat or carcases, or of animal feed, implements, waste, droppings, manure litter or anything liable to transmit avian influenza be subject to authorization by the competent authority;

   (e) eggs shall leave the holding with the exception of eggs sent directly to an establishment approved for the manufacture and/or processing of egg products under Article 6 (1) of Directive 89/437/EEC (2), and transported under an authorization which has been granted by the competent authority. Such authorization must meet the requirements laid down in Annex I;

   (f) appropriate means of disinfection be used at the entrances and exits of buildings housing poultry and of the holding itself;

   (g) an epizootiological inquiry be carried out in accordance with Article 7.

3. Until such time as the official measures laid down in paragraph 5 are enforced, the owner or keeper of any poultry in which disease is suspected shall take all reasonable action to ensure compliance with paragraph 2, except for (g) thereof.

4. The competent authority may apply any of the measures provided for in paragraph 2 to other holdings should their location, their configuration or contacts with the holding where the disease is suspected give reason to suspect possible contamination.

5. The measures referred to in paragraphs 1 and 2 shall not be withdrawn until the suspicion of avian influenza has been ruled out by the official veterinarian.

**Article 5**

1. Once the presence of avian influenza has been officially confirmed on a holding, the Member States shall ensure that the competent authority requires, in addition to the measures listed in Article 4 (2), the following measures to be undertaken:

(a) all poultry on the holding shall without delay be killed and all eggs shall be destroyed. These operations shall be carried out in a way which minimizes the risk of spreading disease;

(b) any substance or waste, such as animal feed, litter or manures liable to be contaminated, shall be destroyed or treated appropriately. This treatment, carried out in accordance with the instructions of the official veterinarian, shall ensure the destruction of any avian influenza virus present;

(c) where poultry from the holding have been slaughtered during the presumed incubation period of disease the meat from those poultry shall wherever possible be traced and destroyed;

(d) hatching eggs laid during the presumed incubation period which have been moved from the holding shall be traced and destroyed; but poultry which have already hatched from the eggs shall be placed under official surveillance; table eggs laid during the presumed incubation period which have been moved from the holding shall wherever possible be traced and destroyed, unless they have previously been properly disinfected;

(e) after carrying out operations listed in subparagraphs (a) and (b) the buildings used for housing poultry, their surroundings, the vehicles used for transport and all equipment likely to be contaminated shall be cleaned and disinfected in accordance with the provisions of Article 11;

(f) no poultry shall be reintroduced to the holding until at least 21 days after completion of operations provided for in subparagraph (e);

(g) an epizootiological inquiry shall be carried out in accordance with Article 7.

2. The competent authority may extend the measures provided for in paragraph 1 to other neighbouring holdings should their location, their configuration, or contact with the holding where the disease has been confirmed give reason to suspect possible contamination.

Article 6

In the case of holdings which consist of two or more separate flocks, the competent authority may, in accordance with criteria set by the Commission under the procedure laid down in Article 21, grant a derogation from the requirements of Article 5 (1), for healthy flocks of a holding which is infected, provided that the official veterinarian has confirmed that the operations carried out there are such that the flocks are completely separate as regards housing, keeping and feeding, so that the virus cannot spread from one flock to another.

Article 7

1. The epizootiological inquiry shall deal with:

— the possible origin of the avian influenza on the holding and the identification of other holdings on which there are poultry which may have become infected or contaminated from the same source,

— the movement of persons, poultry or other animals, vehicles, eggs, meat and carcasses and any implement or substance likely to have carried avian influenza virus to or from the holding in question.

2. In order to provide full coordination of all measures necessary to ensure eradication of avian influenza as quickly as possible and for the purpose of carrying out the epidemiological inquiry, a crisis unit shall be established.

The general rules concerning national crisis units and Community crisis units will be laid down by the Council, acting by a qualified majority proposal from the Commission.

Article 8

1. Where the official veterinarian has reason to suspect that poultry on any holding may have been contaminated as a result of the movement of persons, animals or vehicles or in any other way, that holding shall be placed under official control in accordance with paragraph 2.

2. The purpose of the official control shall be to detect immediately any suspicion of avian influenza, count the poultry and monitor their movements and, where appropriate, to take the action provided for in paragraph 3.

3. When a holding is subject to the official control under paragraphs 1 and 2, the competent authority shall prohibit removal of poultry from the holding other than for transport directly to a slaughterhouse under official supervision for the purpose of immediate slaughter. Before granting such authorization, the official veterinarian must have carried out a clinical examination of all the poultry to exclude presence of avian influenza on the holding. The movement restrictions referred to in this Article shall be imposed for a period of 21 days from the latest date of potential contamination; however, such restrictions must apply for a period of at least seven days.

4. Where it considers that conditions permit, the competent authority may limit the measures provided for in this Article to a part of the holding and to the poultry contained therein, provided that the poultry there have been housed, kept and fed completely separately by separate staff.

Article 9

1. Once the diagnosis of avian influenza has been officially confirmed, the Member States shall ensure that the competent authority establishes around the infected holding a protection zone based on a minimum radius of three kilometres, itself contained in a surveillance zone based on a minimum radius of 10 kilometres. The establishment of the zones must take account of geographical, administrative, ecological and epizootiological factors relating to avian influenza, and of monitoring facilities.
2. The measures applied in the protection zone shall include:

(a) the identification of all holdings having poultry within the zone;

(b) periodic visits to all the holdings having poultry, a clinical examination of those poultry included, if necessary, the collection of samples for laboratory examination; a record of visits and findings must be kept;

(c) the keeping of all poultry in their living quarters or some other place where they can be isolated;

(d) the use of appropriate means of disinfection at the entrances and exits of the holding;

(e) the control of movements of persons handling poultry, poultry carcases and eggs and vehicles carrying poultry, carcases and eggs within the zone; in general, transport of poultry shall be prohibited, except for transit by major highways or railways;

(f) a prohibition on removing poultry and hatching eggs from the holding on which they are kept unless the competent authority has authorized the transport;

(i) of poultry for immediate slaughter to a slaughterhouse preferably located in the infected area or, if that is not possible, to a slaughterhouse designated by the competent authority outside the infected area. The special health mark provided for in Article 5 (1) of Directive 91/494/EEC (1) must be applied to this poultry meat;

(ii) of day-old chicks or ready-to-lay pullets to a holding within the surveillance zone at which there are no other poultry. This holding must be placed under the official control provided for in Article 8 (2);

(iii) of hatching eggs to a hatchery designated by the competent authority; before dispatch, eggs and their packing must be disinfected. Movements allowed in (i), (ii) and (iii) shall be directly executed, under official control. They shall be authorized only after the official veterinarian has carried out a health inspection of the holding. The means of transport used must be cleaned and disinfected before and after use;

(g) a prohibition on removing or spreading used litter or poultry manure without authorization;

(h) the prohibition of fairs, markets, shows or other gatherings of poultry or other birds.

3. The measures applied in the protection zone shall be maintained for at least 21 days after the carrying out of preliminary cleaning and disinfection operations on the infected holding in accordance with Article 11. The protection zone shall thereafter be part of the surveillance zone.

4. The measures applied in the surveillance zone shall include:

(a) the identification of all holdings having poultry within the zone;

(b) the control of poultry and hatching egg movement within the zone;

(c) a prohibition on the movement of poultry out of the zone during the first 15 days, except for movement directly to a slaughterhouse outside the surveillance zone designated by the competent authority. The special health mark provided for in Article 3 of Directive 91/494/EEC must be applied to this poultry meat;

(d) a prohibition on the movement of hatching eggs out of the surveillance zone unless to a hatchery designated by the competent authority. Before dispatch the eggs and their packing must be disinfected;

(e) a prohibition on the movement of used litter or poultry manure out of the zone;

(f) a prohibition of fairs, markets, shows or other gatherings of poultry and other birds;

(g) without prejudice to the provisions of (a) and (b), the prohibition of transport of poultry except for transit by major highways or railways.

5. The measures applied in the surveillance zone shall be maintained for at least 30 days after the carrying out of preliminary cleaning and disinfection operations on the infected holding in accordance with Article 11.

6. Where the zones are situated in the territory of more than one Member State, the competent authorities of the Member States concerned shall cooperate in establishing the areas described in paragraph 1. However, if necessary, the protection zone and the surveillance zone shall be established by the procedure provided for in Article 21.

Article 10

Member States shall ensure that:

(a) the competent authority determines the arrangements allowing them to trace the movement of eggs and poultry;

(b) the owner or keeper of poultry is required to supply the competent authority, in response to any request by that authority, with information concerning poultry and eggs entering or leaving his holding;

(c) all persons engaged in the transport or marketing of poultry and eggs are able to supply the competent authority with information concerning the movements of poultry and eggs which they have transported or marketed and to furnish all the details concerning such information.

Article 11

Member States shall ensure that:

(a) the disinfectants to be used and their concentrations are officially approved by the competent authority;

(b) the cleaning and disinfection operations are carried out under official supervision, in accordance with:
   (i) instructions given by the official veterinarian,
   (ii) the procedure for cleaning and disinfecting an infected holding, as laid down in Annex II.

Article 12

Collection of samples and laboratory testing to detect the presence of avian influenza virus shall be carried out in accordance with Annex III.

Article 13

Member States shall ensure that the competent authority takes all the necessary measures for persons established in the protection and surveillance zones to be informed of the restrictions in force and make all necessary arrangements for the appropriate implementation of the measures in question.

Article 14

1. Member States shall ensure that, in each Member State there is designated:

(a) a national laboratory at which facilities and expert personnel shall be maintained to permit assessment of the pathogenicity of influenza virus isolates, in accordance with Annex III, Chapter 7, and identification of influenza A viruses of H5 or H7 subtypes;

(b) a national laboratory at which reagents for use in regional laboratories are tested;

(c) a national institute or laboratory at which authorized vaccines may be tested in order to verify their conformity with the specifications laid down in the marketing authorization.

2. The national laboratories listed in Annex IV shall be responsible for coordinating standards and methods of diagnosis, use of reagents and testing of vaccines.

3. The national laboratories listed in Annex IV shall be responsible for coordinating the standards and diagnostic methods laid down in each avian influenza diagnostic laboratory within the Member State. To this end:

(a) they may provide diagnostic reagents to national laboratories;

(b) they shall control the quality of all diagnostic reagents used in that Member State;

(c) they shall arrange comparative tests periodically;

(d) they shall hold isolates of avian influenza virus from cases confirmed in that Member State;

(e) they shall ensure the confirmation of positive results obtained in regional diagnostic laboratories.

4. The national laboratories listed in Annex IV shall liaise with the Community reference laboratory referred to in Article 15.

Article 15

The Community reference laboratory for avian influenza is mentioned in Annex V. Without prejudice to the provisions of Decision 90/424/EEC, and in particular Article 28 thereof, the powers and duties of the laboratory shall be those appearing in the said Annex.

Article 16

Vaccination against avian influenza with vaccines authorized by the competent authority may only be used to supplement the control measures carried out when the disease appears and in accordance with the following provisions:

(a) the decision to introduce vaccination to supplement control measures shall be taken by the Commission in collaboration with the Member State concerned, acting in accordance with the procedure laid down in Article 21. This decision shall have particular regard to:
   — the concentration of poultry in the affected area,
   — the characteristics and composition of the vaccine to be used,
   — the procedures for supervision of the distribution, storage and use of vaccines,
   — the species and categories of poultry which shall be subject to vaccination,
   — the areas in which vaccination shall be carried out.

However, by way of derogation from the first subparagraph, the decision to introduce emergency vaccination around the outbreak may be taken by the Member State concerned, following notification to the Commission, provided the fundamental interests of the Community are not jeopardized. Such decision will be re-examined immediately within the Standing Veterinary Committee in accordance with the procedure provided for in Article 21;

(b) where a Member State is authorized, in accordance with point (a), to have recourse to emergency vaccination on a limited part of its territory the status of the remainder of the territory shall not be affected, provided that the immobilization measures for the vaccinated animals are effective during a period to be determined in accordance with the procedure laid down in Article 21.

Article 17

1. Each Member State shall draw up a contingency plan, specifying the national measures to be implemented in the event of an outbreak of avian influenza.
This plan must allow access to facilities, equipment, personnel and all other appropriate materials necessary for the rapid and efficient eradication of the outbreak.

2. The criteria to be applied for drawing up the plan are laid down in Annex VI.

3. Plans drawn up in accordance with the criteria listed in Annex VI shall be submitted to the Commission not later than six months after this Directive is brought into application.

4. The Commission shall examine the plans in order to determine whether they permit the desired objective to be attained and shall suggest to the Member State concerned any amendments required in particular to ensure that they are compatible with those of the other Member States.

The Commission shall approve the plans, if necessary amended, in accordance with the procedure laid down in Article 21.

The plans may subsequently be amended or supplemented, in accordance with the same procedure, to take into account developments in the situation.

**Article 18**

1. Commission experts may, in collaboration with the competent authorities, and insofar as is necessary to ensure uniform application of this Directive, make on-the-spot checks. In order to do this, they may check a representative percentage of establishments to see whether the competent authorities are checking that these establishments are fulfilling the requirements of this Directive. The Commission shall inform the Member States of the result of the checks carried out.

A Member State in whose territory a check is being carried out shall give all the necessary assistance to the experts in carrying out their duties.

The general provisions for implementing this Article shall be determined in accordance with the procedure laid down in Article 21.

**Article 19**

The detailed conditions governing the Community’s financial contribution to the measures connected with the application of this Directive are laid down in Decision 90/424/EEC.

**Article 20**

The Annexes shall be amended, as and when required, by the Council acting by a qualified majority acting on a proposal from the Commission in particular in order to take into account developments in research and in diagnostic procedures.

**Article 21**

1. Where the procedure laid down in this Article is to be followed, the Standing Veterinary Committee, set up by Decision 68/361/EEC (1), hereinafter referred to as the ‘the Committee’, shall be informed without delay by its Chairman either on his own initiative or at the request of the representative of a Member State.

2. The representative of the Commission shall submit to the committee a draft within a time limit which the chairman may lay down according to the urgency of the matter. The opinion shall be delivered by the majority laid down in Article 148 (2) of the Treaty in the case of decisions which the Council is required to adopt on a proposal from the Commission. The votes of the representatives of the Member States within the committee shall be weighted in the manner set out in that Article. The chairman shall not vote.

3. (a) The Commission shall adopt the measures envisaged if they are in accordance with the opinion of the committee.

(b) If the measures envisaged are not in accordance with the opinion of the committee, or if no opinion is delivered, the Commission shall, without delay, submit to the Council a proposal relating to the measures to be taken. The Council shall act by a qualified majority.

If, on the expiry of a period of three months from the date of referral to the Council, the Council has not acted, the proposed measures shall be adopted by the Commission save where the Council has decided against the said measures by a simple majority.

**Article 22**

Member States shall bring into force the laws, regulations and administrative provisions necessary to comply with this Directive before 1 January 1993. They shall forthwith inform the Commission thereof.

When Member States adopt these measures, they shall contain a reference to this Directive or shall be accompanied by such reference on the occasion of their official publication. The methods of making such a reference shall be laid down by the Member States.

**Article 23**

This Directive is addressed to the Member States.

*For the Council*

*The President*

Armando MARQUES CUNHA

---

(1) OJ No L 265, 18. 10. 1968, p. 23.
ANNEX I

AUTHORIZATION TO REMOVE EGGS FROM A HOLDING SUBJECT TO THE CONDITIONS OF ARTICLE 4 (2) (e) OF THIS DIRECTIVE

The authorization issued by the competent authority to transport eggs from a suspect holding subject to the provisions of Article 4 (2) (e) to an establishment approved for the manufacture and processing of egg products in accordance with the provisions of Article 6 (1) of Directive 89/437/EEC, hereinafter called the designated establishment, must meet the following conditions:

1. in order to be allowed to be removed from a suspect undertaking, eggs must:
   (a) comply with the requirements laid down in Chapter IV of the Annex to Directive 89/437/EEC;
   (b) be sent directly from the suspect undertaking to the designated establishment; each consignment must be sealed before dispatch by the official veterinarian of the suspect holding and must remain sealed throughout transport to the designated establishment;

2. the official veterinarian of the suspect undertaking shall inform the competent authority of the designated establishment of this intention of sending eggs to it;

3. the competent authority responsible for the designated establishment shall ensure that:
   (a) eggs referred to in 1 (b) will be kept isolated from other eggs from the time they arrive until they are processed;
   (b) the shells of such eggs shall be regarded as high-risk material in accordance with Article 2 (2) of Directive 90/667/EEC (1) and shall be dealt with in accordance with the requirements of Chapter II of that Directive;
   (c) the packaging material, the vehicles used to transport eggs referred to in 1 (b) and all premises with which the eggs come into contact are cleaned and disinfected in such a way as to destroy all avian influenza virus;
   (d) the official veterinarian of the suspect holding shall be informed of all consignments of processed eggs.

---

ANNEX II

PROCEDURE FOR CLEANING AND DISINFECTING AN INFECTED HOLDING

I. Preliminary cleaning and disinfecting

(a) As soon as the carcases of the poultry have been removed for disposal, those parts of the premises in which the poultry was housed and any parts of other buildings, yards etc. contaminated during slaughter or post-mortem examination should be sprayed with disinfectants approved for use in accordance with Article 11 of this Directive.

(b) Any tissue of poultry or eggs which could have contaminated buildings, yards, utensils etc. should be carefully collected and disposed of with the carcases.

(c) The used disinfectant must remain on the surface for at least 24 hours.

II. Final cleaning and disinfection

(a) Grease and dirt should be removed from all surfaces by the application of a degreasing agent and washed with water,

(b) After washing with water as described in (a), further spraying with disinfectant should be applied,

(c) After seven days the premises should be treated with a degreasing agent, rinsed with cold water, sprayed with disinfectant and rinsed again with water.

(d) Used litter and manure must be treated by a method capable of killing the virus. This method must comprise one of the following practices:

   (i) incineration or steam treatment at a temperature of 70° C;

   (ii) burying deep enough to prevent access by vermin and wild birds;

   (iii) stacking and dampening (if necessary to facilitate fermentation), covering to keep in the heat so that a temperature of 20° C is attained and leaving covered for 42 days so as to prevent access by vermin and wild birds.
ANNEX III

DIAGNOSTIC PROCEDURES FOR THE CONFIRMATION AND DIFFERENTIAL DIAGNOSIS OF AVIAN INFLuenza (AI)

The following procedures for the isolation and characterization of avian influenza viruses should be regarded as guidelines and the minima to be applied in the diagnosis of the disease.

For the purpose of the diagnostic procedures for the confirmation and differential diagnosis of avian influenza the following definition shall apply.

'Avian influenza' means an infection of poultry caused by any influenza A virus which has an intravenous pathogenicity index in six-week-old chickens greater than 1.2 or any infection with influenza A viruses of H5 or H7 subtype for which nucleotide sequencing has demonstrated the presence of multiple basic amino acids at the cleavage site of the haemagglutinin.

CHAPTER 1
Sampling and treatment of samples

1. Samples
Cloacal swabs (or faeces) and tracheal swabs from sick birds; faeces or intestinal contents, brain tissue, trachea, lungs, liver, spleen and other obviously affected organs from recently dead birds.

2. Treatment of samples
The organs and tissues listed in paragraph 1 may be pooled, but separate treatment of faecal material is essential. Swabs should be placed in sufficient antibiotic medium to ensure full immersion. Faeces samples and organs should be homogenized (in an enclosed blender or using a pestle and mortar and sterile sand) in antibiotic medium and made to 10—20% w/v suspensions in the medium. The suspensions should be left for about two hours at ambient temperature (or longer periods at 4°C) and then clarified by centrifugation (e.g. 800 to 1 000 x g for 10 minutes).

3. Antibiotic medium
Different laboratories have used various formulations of antibiotic medium with success and National Laboratories will be able to offer advice for a particular country. High concentrations of antibiotics are required for faeces samples and a typical mixture is: 10 000 units/ml penicillin, 10 mg/ml streptomycin, 0.25 mg/ml gentamycin and 5 000 units/ml mycostatin in phosphate buffered saline. These levels can be reduced up to five-fold for tissues and tracheal swabs. For control of Chlamydia organisms 50 mg/ml oxytetracycline may be added. It is imperative when making the medium that the pH is checked after the addition of the antibiotics and readjusted to pH 7.0—7.4.

CHAPTER 2
Virus isolation

Virus isolation in embryonated fowls' eggs
The clarified supernatant fluid should be inoculated in 0.1—0.2 ml amounts into the allantoic cavity of each of a minimum of four embryonated fowl's eggs which have been incubated for eight to 10 days. Ideally, these eggs should be obtained from a specific pathogen free flock, but when this is impracticable it is acceptable to use eggs obtained from a flock shown to be free of antibodies to avian influenza. The inoculated eggs are held at 37°C and candled daily. Eggs with dead or dying embryos as they arise, and all remaining eggs six days after inoculation should be chilled to 4°C and the allantoic-amniotic fluids tested for haemagglutination activity. If no haemagglutination is detected, the above procedure is repeated using undiluted allantoic/amniotic fluid as inoculum.

When haemagglutination is detected the presence of bacteria should be excluded by culture. If bacteria are present the fluids may be passed through a 450 nm membrane filter, further antibiotics added and inoculated into embryonated eggs as above.
CHAPTER 3

Differential diagnosis

1. Preliminary differentiation

Because it is important that control measures aimed at limiting the spread of virus should be implemented as soon as possible, each regional laboratory should be in a position to identify any isolated haemagglutinating virus as influenza viruses of H5 or H7 subtype in addition to Newcastle disease virus. The haemagglutinating fluids should be used in a haemagglutination inhibition test as described in Chapters 5 and 6. Positive inhibition i.e. 2^2 or more, with monoclonal antisera specific for H5 or H7 subtypes of influenza A and of a titre of at least 2^3 would serve as preliminary identification enabling the imposition of interim control measures.

2. Confirmatory identification

Since there are 13 haemagglutinin subtypes and nine neuraminidase subtypes of influenza viruses and variations occur within each of these it is not practicable nor cost effective for each national laboratory to hold antisera which will allow full antigenic characterization of influenza isolates. However, each national laboratory should:

(i) confirm that the isolate is an influenza A virus using an immunodoublediffusion test to detect group antigens as described in Chapter 9 (immunofluorescence or ELISA techniques to detect group antigens may be used if preferred by the national laboratory);

(ii) determine whether or not the isolate is of H5 or H7 subtype;

(iii) carry out an intravenous pathogenicity index test in six-week-old chickens as described in Chapter 7. Intravenous pathogenicity indices of greater than 1.2 indicate the presence of virus requiring a full implementation of control measures (it would be a useful exercise if national Laboratories also carried out tests to determine the capacity of an isolate to produce plaques in cell cultures as specified in Chapter 8).

National laboratories should immediately submit all avian influenza and all H5 and H7 isolates to the Community Reference laboratory for full characterization.

3. Further typing and characterization of isolates

The Community Reference Laboratory should receive all haemagglutinating viruses from the national laboratories for further antigenic and genetic studies to enable a greater understanding of the epizootiology of the disease(s) within the European Community in keeping with the functions and duties of the reference laboratory.

In addition to these duties the Community Reference Laboratory shall carry out full antigenic typing for all influenza viruses received. For H5 and H7 viruses which do not have intravenous pathogenicity indices greater than 1.2, nucleotide sequencing of the haemagglutinin gene to determine whether or not there are multiple basic amino acids at the cleavage site of the haemagglutinin protein should also be carried out.

CHAPTER 4

Serological tests for avian influenza virus antibodies

1. During eradication programmes where the H subtype of the virus responsible is already known, or by using the homologous virus as antigen, serological monitoring for evidence of infection may be done using haemagglutination inhibition tests as described in Chapters 5 and 6.

If the haemagglutinin subtype is not known, evidence for infection with influenza A viruses may be obtained by detecting antibodies directed to the group specific antigens.

For this purpose either an immunodoublediffusion test (as described in Chapter 9) or an ELISA test may be used (a problem with ELISA is the host specificity of the test since it is dependent on the detection of host immunoglobulins). Waterfowl rarely give positive results in immunodoublediffusion tests and, unless the subtype is known, it is probably only practicable to examine such birds for the presence of antibodies to H5 and H7 subtypes.

2. (a) Samples

Blood samples should be taken from all birds if the flock size is less than 20 and from 20 birds from larger flocks (this will give a 99% probability of detecting at least one positive serum if 25% or more of the flock is positive, regardless of flock size). The blood should be allowed to clot and serum removed for testing.
(b) Examination for antibodies

Individual serum samples should be tested for their ability to inhibit influenza virus haemagglutinating antigen in standard haemagglutination inhibition tests as defined in Chapter 6.

There is some debate as to whether 4 or 8 haemagglutinin units should be used for the H1 tests. It would appear that either is valid and the choice should be left to the discretion of the national laboratories. However, the antigen used will affect the level at which a serum is considered positive; — for 4 HAU a positive serum is any showing a titre of 2\(^4\) or greater, for 8 HAU a positive serum is any showing a titre of 2\(^8\) or greater.

CHAPTER 5

Haemagglutination (HA) test

Reagents

1. Isotonic saline buffered with phosphate (0,05M) to pH 7,0—7,4.
2. Red blood cells (RBC) taken and pooled from a minimum of three specific pathogen free chickens (if not available blood may be taken from birds regularly monitored and shown to be free of Avian influenza antibodies) into an equal volume of Alsever\'s solution. Cells should be washed three times in PBS before use. For the other test a 1 % suspension (packed cell v/v) in PBS is recommended.
3. The Community Reference Laboratory will supply or recommend H5 and H7 viruses of low virulence for use as standard antigens.

Procedure

1. Dispense 0,025 ml PBS into each well of a plastic microtitre plate (V-bottomed wells should be used).
2. Place 0,025 ml of virus suspension (i.e. allantoic fluid) in the first well.
3. Use a microtitration diluter to make two-fold dilutions (1:2 to 1:4 096) of virus across the plate.
4. Dispense a further 0,025 ml of PBS to each well.
5. Add 0,025 ml of 1 % red blood cells to each well.
6. Mix by tapping gently and place at 4\(^\circ\) C.
7. Plates are read 30—40 minutes later when Red Blood Cells control are settled. Reading is done by tilting the plate and observing the presence or absence of tear-shaped streaming of the RBCs. Wells with no HA should flow at the same rate as the control cells with no virus.
8. The HA titre is the highest dilution that causes agglutination of the RBCs. That dilution may be regarded as containing one HA unit (HAU). A more accurate method for determining the HA titre is to do HA tests on virus from a close range of initial dilutions i.e. 1:3, 1:4, 1:5, 1:6, etc. This is recommended for the accurate preparation of antigen for haemagglutination inhibition tests (Chapter 6).

CHAPTER 6

Haemagglutination inhibition (HI) test

Reagents

1. Phosphate buffer solution (PBS).
2. Virus containing allantoic fluid diluted with PBS to contain 4 or 8 HAU per 0,025 ml.
3. 1 % chicken RBCs.
4. Negative control chicken serum.
5. Positive control serum.

Procedure

1. Dispense 0,025 ml PBS into all wells of a plastic microtitre plate (with V-bottomed wells).
2. Place 0,025 ml of serum into first well of plate.
3. Use microtitration diluter to make two-fold dilutions of serum across plate.
4. Add 0.025 ml of diluted allantoic fluid containing 4 or 8 HAU.
5. Mix by tapping and place plate at 4°C for a minimum of 60 minutes or room temperature for a minimum of 30 minutes.
6. Add 0.025 ml 1% RBCs to all wells.
7. Mix by gentle tapping and place at 4°C.
8. Plates are read after 30—40 minutes when control RBCs are settled. This is done by tilting and observing the presence or absence of tear-shaped streaming at the same rate as control wells containing RBCs (0.025 ml and PBS (0.05 ml) only.
9. The HI titre is the highest dilution of antiserum causing complete inhibition of four or eight units of virus (an HA titration to confirm the presence of the required HAU should be included in each test).
10. The validity of the results is dependent on obtaining a titre of less than 2¹ for 4 HAU or 2² for 8 HAU with a negative control serum and a titre of within one dilution of the known titre of the positive control serum.

**CHAPTER 7**

**Intravenous Pathogenicity Index (IVPI)**

1. Infective allantoic fluid from the lowest passage level available, preferably from the initial isolation without any selection, is diluted 1⁰ in sterile isotonic saline.
2. 0.1 ml diluted virus is injected intravenously into each of 10 six-week-old chickens (specific pathogen free birds should be used).
3. Birds are examined at 24 hour intervals for 10 days.
4. At each observation each bird is recorded normal (0), sick (1), severely sick (2) or dead (3).
5. Record results and calculate index as shown in this example:

<table>
<thead>
<tr>
<th>Clinical Signs</th>
<th>Day after inoculation</th>
<th>Total Score</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1 2 3 4 5 6 7 8 9 10</td>
<td></td>
</tr>
<tr>
<td>Normal</td>
<td>10 2 0 0 0 0 0 0 0 0</td>
<td>12 x 0 = 0</td>
</tr>
<tr>
<td>Sick</td>
<td>0 4 2 0 0 0 0 0 0 0</td>
<td>6 x 1 = 6</td>
</tr>
<tr>
<td>Severely sick (*)</td>
<td>0 2 2 2 0 0 0 0 0 0</td>
<td>6 x 2 = 12</td>
</tr>
<tr>
<td>Dead</td>
<td>0 2 6 8 10 10 10 10 10 10</td>
<td>76 x 3 = 228</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Total = 246</td>
</tr>
</tbody>
</table>

Index = mean score per bird per observation = \( \frac{246}{100} = 2.46 \)

(*) This has to be a subjective clinical judgment but normally this would involve birds showing more than one of the following signs: respiratory involvement, depression, diarrhoea, cyanosis of exposed skin or wattles, oedema of face and/or head, nervous signs.

**CHAPTER 8**

**Assessment of plaque-forming ability**

1. It is usually best to use a dilution range of virus to ensure that an optimum number of plaques are present on the plate. Ten-fold dilutions up to 10⁻² in PBS should be sufficient.
2. Confluent monolayers of chick embryo cells or a suitable cell line (Madin-Darby bovine kidney for example) are prepared in 5 cm diameter Petri dishes.
3. 0,2 ml of each virus dilution is added to each of two Petri dishes and the virus allowed to absorb for 30 minutes.

4. After washing three times with PBS the infected cells are overlaid with the relevant medium containing 1 % w/v agar and either 0,01 mg/ml trypsin or no trypsin. It is important that no serum is added to the overlay medium.

5. After 72 hours incubation at 37° C the plaques should be of sufficient size. They are best seen by removing the agar overlay and staining the cell monolayer with crystal violet (0,5 % w/v) in 25 % v/v ethanol.

6. All viruses should give clear plaques when incubated in the presence of trypsin in the overlay. When trypsin is absent from the overlay only viruses virulent for chickens will produce plaques.

CHAPTER 9
Immunodoublediffusion

The preferred method to show the presence of influenza A virus is to demonstrate the possession of the nucleocapsid or matrix antigens which are shared by all influenza A virus. This is generally done in immunodoublediffusion tests involving either concentrated virus preparations or extracts from infected chorioallantoic membranes.

Suitable preparations of concentrated virus may be made by simple high speed centrifugation of infectious allantoic fluid and disruption of virus to release the internal nucleocapsid and matrix antigens by treatment with the detergent sodium lauroyl sarcosinate. Acid precipitation may also be used by adding 1N HCl to infectious allantoic fluid to give a final pH of 3,5—4,0, chilling for at least one hour at 0° C and low speed centrifugation at 1 000 g for 10 minutes.

The supernatant may be discarded and the virus-containing precipitate resuspended in a minimum volume of glycine-sarkosyl buffer (1 % sodium lauroyl sarcosinate buffered to pH 9,0 with a 0,5M glycine). These preparations possess both nucleocapsid and matrix antigens.

Beard (1970) described the preparation of nucleocapsid-rich antigen from chorioallantoic membranes removed from infected eggs. This method involves: removal of the chorioallantoic membranes from infected haemagglutinin positive eggs, grinding or homogenising the membranes, freezing and thawing three times followed by centrifugation at 1 000 g for 10 minutes. The pellet is discarded and the supernatant treated with 0,1 % formalin for use as antigen.

Either of these two antigens may be used in immunodoublediffusion tests using 1 % agarose, or agar, gels containing 8,0 % sodium chloride made up to 0,1M phosphate buffer pH 7,2. Influenza A virus is confirmed by precipitin lines formed by test antigen and known positive antigen against a known positive antiserum coalescing to give a line of identity.

ANNEX V

COMMUNITY REFERENCE LABORATORY FOR AVIAN INFLUENZA

Name of Laboratory
Central Veterinary Laboratory,
New Haw,
UK-Weybridge,
Surrey KT 15 3NB,
United Kingdom.

The functions and duties of the EC reference laboratory for avian influenza shall be:

1. to coordinate, in consultation with the EC Commission, the methods employed in the Member States for diagnosing avian influenza. Specifically by:
   (a) typing, storing and supplying strains of avian influenza virus for serological tests and the preparation of antisera;
   (b) supplying standard sera and other reference reagents to the National Reference Laboratories in order to standardize the tests and reagents used in the Member States;
   (c) building up and retaining a collection of avian influenza virus strains and isolates;
   (d) organizing periodical comparative tests of diagnostic procedures at Community level;
   (e) collecting and collating data and information on the methods of diagnosis used and the results of tests carried out in the Community;
   (f) characterizing isolates of avian influenza viruses by the most up-to-date methods available to allow greater understanding of the epizootiology of avian influenza and to gain an insight into the epizootiology of the virus and the emergence of highly pathogenic and potentially pathogenic strains;
   (g) keeping abreast of developments in avian influenza surveillance, epizootiology and prevention throughout the world;
   (h) retaining expertise on avian influenza virus and other pertinent viruses to enable rapid differential diagnosis;
   (i) acquiring a thorough knowledge of the preparation and use of the products of veterinary immunology used to eradicate and control avian influenza;

2. to actively assist in the diagnosis of avian influenza outbreaks in Member States by receiving virus isolates for confirmatory diagnosis, characterization and epizootiological studies. In particular, the laboratory should be able to carry out nucleotide sequencing analysis to allow determination of the deduced amino acid sequence at the cleavage site of the haemagglutinin molecule of avian influenza viruses of H5 or H7 subtype;

3. to facilitate the training or retraining of experts in laboratory diagnosis with a view to the harmonization of techniques throughout the Community.
ANNEX VI

CRITERIA FOR CONTINGENCY PLANS

Contingency plans shall meet at least the following criteria:

1. the establishment of a crisis centre on a national level, which shall coordinate all control measures in the Member State concerned;

2. a list shall be provided of local disease control centres with adequate facilities to coordinate the disease control measures at a local level;

3. detailed information shall be given about the staff involved in control measures, their skills and their responsibilities;

4. each local disease control centre must be able to contact rapidly persons/organizations which are directly or indirectly involved in an outbreak;

5. equipment and materials shall be available to carry out the disease control measures properly;

6. detailed instructions shall be provided on action to be taken on suspicion and confirmation of infection or contamination, including proposed means of disposal of carcases;

7. training programmes shall be established to maintain and develop skills in field and administrative procedures;

8. diagnostic laboratories must have facilities for post-mortem examination, the necessary capacity for serology, histology etc. and must maintain the skills for rapid diagnosis. Arrangements must be made for rapid transportation of samples;

9. details shall be provided of the quantity of avian influenza vaccine estimated to be required in the event of a reinstatement of emergency vaccination;

10. provisions shall be made to ensure the legal powers necessary for the implementation of the contingency plans.
COUNCIL DIRECTIVE 92/42/EEC
of 21 May 1992

on efficiency requirements for new hot-water boilers fired with liquid or gaseous fuels

THE COUNCIL OF THE EUROPEAN COMMUNITIES,

Having regard to the Treaty establishing the European Economic Community, and in particular Article 100a thereof,

Having regard to the proposal from the Commission (1),

In cooperation with the European Parliament (2),

Having regard to the opinion of the Economic and Social Committee (3),

Whereas Decision 91/565/EEC (4) provides for the promotion of energy efficiency in the Community under the SAVE programme;

Whereas it is important to promote measures aimed at the progressive establishment of the internal market in the period up to 31 December 1992; whereas the internal market encompasses an area without internal frontiers, in which the free circulation of goods, persons, services and capital is assured;

Whereas the Council resolution of 15 January 1985 on the improvement of energy-saving programmes in the Member States (5) invites Member States to pursue and where necessary increase their efforts to promote the more rational use of energy by the further development of integrated energy-saving policies;

Whereas the Council resolution of 16 September 1986 concerns new Community energy-policy objectives for 1985 and convergence of the policies of the Member States (6), and in particular the objective of improving the efficiency of final energy demand by at least 20%;

Whereas Article 130r of the Treaty provides that action by the Community relating to the environment shall have the objective of ensuring a prudent and rational utilization of natural resources;

Whereas it is appropriate to take as a base a high level of protection in proposals for the approximation of the provisions laid down by law, regulation or administrative action in Member States and concerning health, safety, environmental protection and consumer protection;

Whereas the Council resolution of 21 June 1989 declares 'that the Community should take proper account of potential climatic change linked to the greenhouse effect' (7) and the Council's conclusions of 29 October 1990 state that CO₂ emissions in the year 2000 should be stabilized throughout the Community at their 1990 level;

Whereas the importance of the domestic and tertiary sector, which absorbs a major proportion of the final consumption of energy in the Community, is considerable;

Whereas this sector will become even more important through trends towards more central heating and a general increase in thermal comfort;

Whereas better boiler efficiency is in the consumer's interest; whereas energy saving will be reflected in fewer imports of hydrocarbons; whereas reduction in the Community's energy dependence will have a positive impact on its trade balance;

Whereas Council Directive 78/170/EEC of 13 February 1978 on the performance of heat generators for space heating and the production of hot water in new or existing non-industrial buildings and on the insulation of heat and domestic hot-water distribution in new non-industrial buildings (8), has given rise to the establishment of substantially different efficiency levels between one Member State and another;

Whereas the requirement of high efficiency for hot-water boilers will reduce the range of technical properties of equipment placed on the market, thus facilitating series production and making for economies of scale; whereas the absence of a measure laying down energy requirements at a sufficiently high level may result, with the completion of the internal market, in a significant drop in the efficiency levels of heating installations through the spread on the market of low-efficiency boilers;

Whereas local climatic conditions and the energy and occupancy characteristics of buildings differ greatly within the Community; whereas Member States must take this diversity into account when determining the conditions for putting boilers into service in implementation of this Directive; whereas these circumstances justify the fact that Member States where back-boilers and boilers designed to be installed in the living space are widely installed at the date of

(3) OJ No C 102, 18. 4. 1991, p. 46.
(4) OJ No L 307, 8. 11. 1991, p. 34.
Whereas this Directive, which is aimed at eliminating technical barriers with regard to boiler efficiency, must follow the new approach established by the Council resolution of 7 May 1985 (\(^1\)) which specifically lays down that legislative harmonization is limited to the adoption, by means of directives based on Article 100 of the EEC Treaty, of the essential requirements with which products put on the market must conform and that ‘these essential requirements shall be worded precisely enough in order to create legally binding obligations which can be enforced and to enable the certification bodies to certify products as being in conformity, having regard to those requirements in the absence of standards’;

Having regard to Directive 83/189/EEC (\(^2\)) laying down a procedure for the provision of information in the field of technical standards and regulations;

Having regard to Decision 90/683/EEC (\(^3\)) concerning the modules for the various phases of the conformity assessment procedures which are intended to be used in the technical harmonization directives;

Whereas boilers complying with the efficiency requirements should bear the CE mark and, where appropriate, signs in order to enable them to move freely and to be put into service in accordance with their intended purpose within the Community;

Having regard to Directive 89/106/EEC (\(^4\)) on the approximation of laws, regulations and administrative provisions of the Member States relating to construction products;

Whereas efficiency requirements to encourage the rational use of energy as laid down in Council Directive 90/396/EEC of 29 June 1990 on the approximation of the laws of the Member States relating to appliances burning gaseous fuels (\(^5\)) should be established for the gas boilers referred to in this Directive,

HAS ADOPTED THIS DIRECTIVE:

Article 1

This Directive, which comes under the SAVE programme concerning the promotion of energy efficiency in the Community, determines the efficiency requirements applicable to new hot-water boilers fired by liquid or gaseous fuels with a rated output of no less than 4 kW and no more than 400 kW, hereinafter called ‘boilers’.

Article 2

For the purposes of this Directive:

- boiler: the combined boiler body-burner unit, designed to transmit to water the heat released from burning,
- appliance:
  - the boiler body designed to have a burner fitted,
  - the burner designed to be fitted to a boiler body,
- effective rated output (expressed in kW): the maximum calorific output laid down and guaranteed by the manufacturer as being deliverable during continuous operation while complying with the useful efficiency indicated by the manufacturer,
- useful efficiency (expressed in %): the ratio between the heat output transmitted to the boiler water and the product of the net calorific value at constant fuel pressure and the consumption expressed as a quantity of fuel per unit time,
- part load (expressed in %): the ratio between the effective output of a boiler operating intermittently or at an output lower than the effective rated output and the same effective rated output;
- average temperature of the boiler water: the average of the water temperatures at the entry and exit of the boiler,
- standard boiler: a boiler for which the average water temperature can be restricted by design,
- back-boiler: a boiler designed to supply a central-heating system and to be installed in a fireplace recess as part of a back boiler/gas fire combination,
- low-temperature boiler: a boiler which can work continuously with a water supply temperature of 35 to 40° C, possibly producing condensation in certain circumstances, including condensing boilers using liquid fuel,
- gas condensing boiler: a boiler designed to condense permanently a large part of the water vapour contained in the combustion gases,
- boiler to be installed in the living space: a boiler with an effective rated output of less than 37 kW, designed to provide heat to the part of the living space in which it is installed by means of the emission of heat from the casing having an open expansion chamber, supplying hot water

\(^{1}\) OJ No C 136, 4. 6. 1985, p. 1.
\(^{5}\) OJ No L 196, 26. 7. 1990, p. 15.
using gravity circulation; such boilers shall bear on their
casings the explicit indication that they must be installed
in living space.

Article 3

1. The following shall be excluded from this Directive:

— hot-water boilers capable of being fired by different fuels
   including solid fuels,

— equipment for the instantaneous preparation of hot
   water,

— boilers designed to be fired by fuels the properties of
   which differ appreciably from the properties of the liquid
   and gaseous fuels commonly marketed (industrial waste
gas, biogas, etc),

— cookers and appliances designed mainly to heat the
   premises in which they are installed and, as a subsidiary
   function, to supply hot water for central heating and
   sanitary hot water,

— appliances with rated outputs of less than 6 kW using
   gravity circulation and designed solely for the production
   of stored sanitary hot water,

— boilers manufactured on a one-off basis.

2. In the case of boilers with a dual function, that of
   heating premises and also providing sanitary hot water, the
   efficiency requirements referred to in Article 5 (1) concern
   the heating function only.

Article 4

1. Member States may not prohibit, restrict or impede the
   placing on the market or entry into service within their
   territories of appliances and boilers which satisfy the
   requirements of this Directive, save as otherwise laid down in
   the Treaty or other Directives or Community provisions.

2. Member States shall take all necessary measures to
   ensure that boilers cannot be put into service unless they
   satisfy the efficiency requirements set out in Article 5 (1) and
   the conditions for entry into service which the Member States
   lay down on the basis of local climatic conditions and the
   energy and occupancy characteristics of the buildings.

3. However, Member States where back-boilers and/or
   boilers that are to be installed in the living space, are widely
   installed at the date of the adoption of the present Directive,
   shall continue to authorize their entry into service, provided
   that their efficiency both at rated output and at 30% part
   load is not more than 4% below the requirements laid down
   in Article 5 (1) for standard boilers.

4. The effects of the provisions in paragraphs 2 and 3
   shall be constantly monitored by the Commission and
   analysed in the report to be submitted under Article 10. To
   this end the Member States shall forward to the Commission
   any information it requires to submit to the Council the
   proposed amendments, provided for in that Article, designed
   to ensure at all events the energy efficiency and free
   movement of boilers in the Community.

Article 5

1. Boilers must comply with the following useful
   efficiency requirements:

   — at rated output, i.e. operating at rated output Pn
     expressed in kW, at an average boiler-water temperature
     of 70°C,

   and

   — a part load, i.e. operating at 30% part load, at an average
     boiler-water temperature which varies according to the
     type of the boiler.

The useful efficiency requirements to be complied with are
set out in the following table:

<table>
<thead>
<tr>
<th>Type of boiler</th>
<th>Range of power output</th>
<th>Efficiency at rated output</th>
<th>Efficiency at partload</th>
</tr>
</thead>

</table>

(*) Including condensing boilers using liquid fuels.
(**) Temperature of boiler water-supply.
2. The harmonized standards relating to the requirements of this Directive drawn up under mandate from the Commission in accordance with Directive 83/189/EEC and 88/182/EEC (1) shall determine, inter alia, the verification methods valid for production and measurements. Appropriate tolerances must be incorporated in the efficiency levels.

**Article 6**

1. Under the procedures laid down in Article 7, Member States may decide to apply a specific system of labels enabling the energy performance of boilers to be clearly ascertained. This system shall apply to boilers the efficiency of which is superior to the requirements for standard boilers set out in Article 5 (1).

If its efficiency at rated output and its efficiency at part load are equal to or greater than the relevant values for standard boilers, a boiler shall be awarded an '★' as set out in Annex I, section 2.

If its efficiency at rated output and its efficiency at part load are three or more points higher than the relevant values for standard boilers a boiler shall be awarded '★ ★'.

Every extra step of efficiency of three points at rated output and at part load will allow the attribution of an extra '★' as set out in Annex II.

2. Member States may not authorize any other label likely to be confused with those referred to in paragraph 1.

**Article 7**

1. Member States shall deem that boilers which comply with the harmonized standards, the reference numbers of which have been published in the *Official Journal of the European Communities* and for which the Member States have published the reference numbers of the national standards transposing those harmonized standards, to be in conformity with the essential efficiency requirements stipulated in Article 5 (1). Such boilers must bear the CE mark referred to in Annex I, section 1, and be accompanied by the EC declaration of conformity.

2. The conformity of series-produced boilers shall be certified by:

   — examination of the efficiency of a boiler type in accordance with module B as described in Annex III,

   — a declaration of conformity to the approved type in accordance with module C, D or E as described in Annex IV.

For boilers burning gaseous fuels, the procedures for assessing the conformity of their efficiency shall be those used to assess conformity to the safety requirements laid down in Directive 90/396/EEC on the approximation of the laws of the Member States relating to appliances burning gaseous fuels.

3. When appliances marketed separately are placed on the market, they must bear the CE mark and be accompanied by the EC declaration of conformity, which defines the parameters enabling them after assembly to achieve the useful efficiency levels laid down in Article 5 (1).

4. The CE mark of conformity to the requirements of this Directive and to the other provisions concerning the granting of the CE mark, and also the inscriptions specified in Annex I, shall be affixed on boilers in a visible, easily legible and indelible manner. The affixing on such products of any other mark, sign or indication liable to create confusion with the CE mark both as regards its significance or in its appearance shall be prohibited.

**Article 8**

1. Each Member State shall notify the Commission and the other Member States of the bodies it has appointed to carry out the tasks relating to the procedures referred to in Article 7, hereinafter called 'notified bodies'.

The Commission shall allocate identification numbers to those bodies and shall inform the Member States thereof.

Lists of the notified bodies shall be published by the Council in the *Official Journal of the European Communities* and shall be continually updated.

2. Member States shall implement the minimum criteria laid down in Annex V for the appointment of such bodies. Bodies which satisfy the criteria laid down in the corresponding harmonized standards shall be deemed to comply with the criteria laid down in that Annex.

3. A Member State which has notified a particular body must withdraw that notification if it finds that the body concerned no longer satisfies the criteria referred to in paragraph 2. It shall immediately inform the other Member States and the Commission accordingly and shall withdraw the notification.

**Article 9**

1. By 1 January 1993, Member States shall adopt and publish the provisions necessary to comply with this Directive. They shall forthwith inform the Commission thereof.

They shall apply those provisions form 1 January 1994.

When Member States adopt those provisions, they shall contain a reference to this Directive or shall be accompanied

---

(1) OJ No L 81, 26. 3. 1988, p. 75.
by such a reference on the occasion of their official publication. The methods of making such a reference shall be laid down by the Member States.

2. Until 31 December 1997, Member States shall permit the placing on the market and putting into service of appliances complying with the national rules and schemes in force within their territories on the date of the adoption of this Directive.

Article 10

Three years after the implementation of this Directive the Commission shall submit a report to the European Parliament and to the Council on the results achieved. That report shall be accompanied by proposals for any changes to be made to this Directive in the light of those results and of advances in technology.

Article 11

This Directive is addressed to the Member States.

For the Council
The President
Luis MIRA AMARAL
ANNEX I

CONFORMITY MARKS AND ADDITIONAL SPECIFIC MARKINGS

1. Conformity mark
The conformity mark consists of the letters CE as shown below and the last two figures of the year in which the mark was affixed.

![CE]

2. Additional specific markings
The energy performance label awarded under Article 6 of this Directive consists of the following symbol:

![Star]

ANNEX II

AWARD OF ENERGY-PERFORMANCE LABELS

Efficiency requirements to be met both at nominal output and at part-load of 0,3 Pn

<table>
<thead>
<tr>

ANNEX III

Module B: EC type-examination

1. This module describes that part of the procedure by which a notified body ascertains and attests that an example, representative of the production envisaged, meets the relevant provisions of the Directive.

2. The application for EC type-examination is lodged by the manufacturer or his authorized representative established within the Community with a notified body of his choice.

   The application must include:
   — the name and address of the manufacturer and, if the application is lodged by the authorized representative, the name and address in addition,
   — a written declaration that the same application has not been lodged with any other notified body,
   — the technical documents, as described in section 3.

   The applicant must place at the disposal of the notified body an example representative of the production envisaged, hereinafter called 'type'. The notified body may request further examples if needed for carrying out the test programme.

3. The technical documents must enable the conformity of the appliance with the requirements of the Directive to be assessed. They must, as far as is relevant for such assessment, cover the design, manufacture and operation of the appliance and contain as far as is relevant for assessment:
   — a general type-description,
   — conceptual design and manufacturing drawings and diagrams of components, sub-assemblies, circuits, etc.,
   — descriptions and explanations necessary for the understanding of the drawings and diagrams and the operation of the product,
   — a list of the standards referred to in Article 5 (2), applied in full or in part, and descriptions of the solutions adopted to meet the essential requirements of the Directive where the standards referred to in Article 5 have not been applied,
   — results of design calculations made, examinations carried out, etc.,
   — test reports.

4. The notified body must:

4.1. examine the technical documents, verify that the type has been manufactured in conformity with those documents and identify the elements which have been designed in accordance with the relevant provisions of the standards referred to in Article 5 (2) as well as the components which have been designed without applying the relevant provisions of those standards;

4.2. perform or have performed the appropriate examinations and necessary tests to check whether, where the standards referred to in Article 5 (2) have nor been applied, the solutions adopted by the manufacturer meet the essential requirements of the Directive;

4.3. perform or have performed the appropriate examinations and necessary tests to check whether, where the manufacturer has chosen to apply the relevant standards, these have actually been applied;

4.4. agree with the applicant the location where the examinations and necessary tests are to be carried out.

5. Where the type meets the relevant provisions of this Directive, the notified body issues an EC type-examination certificate to the applicant. The certificate contains the name and address of the manufacturer, the conclusion of the examination and necessary data for identification of the approved type.

A list of the relevant parts of the technical documents is annexed to the certificate and a copy kept by the notified body.

If the manufacturer or his authorized representative established in the Community is refused a type certificate, the notified body must provide detailed reasons for such refusal.

Provision must be made for an appeals procedure.
6. The applicant informs the notified body that holds the technical documents concerning the EC type-examination certificate of all modifications to the approved appliance which must receive additional approval where such changes may affect the conformity with the essential requirements or the prescribed conditions for use of the product. This additional approval is given in the form of an addition to the original EC type-examination certificate.

7. Each notified body must communicate to the other notified bodies the relevant information concerning the EC type-examination certificates and additions issued and withdrawn.

8. The other notified bodies may receive copies of the EC type-examination certificates and/or their additions. The Annexes to the certificates must be kept at the disposal of the other notified bodies.

9. The manufacturer or his authorized representative established within the Community must keep with the technical documents copies of EC type-examination certificates and their additions for a period of at least 10 years after the last date of manufacture of the product concerned.

Where neither the manufacturer nor his authorized representative is established within the Community, the obligation to keep the technical documents available is the responsibility of the person who places the product on the Community market.
ANNEX IV

Module C: Conformity to type

1. This module describes that part of the procedure whereby the manufacturer or his authorized representative established within the Community ensures and declares that the appliances concerned are in conformity with the type as described in the EC type-examination certificate and satisfy the requirements of this Directive that apply to them. The manufacturer must affix the CE mark to each appliance and draw up a written declaration of conformity.

2. The manufacturer must take all measures necessary to ensure that the manufacturing process assures the conformity of the manufactured appliances with the type as described in the EC type-examination certificate and with the efficiency requirements of the Directive.

3. The manufacturer or his authorized representative must keep a copy of the declaration of conformity for a period of at least 10 years after the last date of manufacture of the product concerned. Where neither the manufacturer nor his authorized representative is established within the Community, the obligation to keep the technical documents available is the responsibility of the person who places the product on the Community market.

4. A notified body chosen by the manufacturer must perform or have performed examinations of the product at random intervals. A suitable sample of the finished products, taken on the spot by the notified body, is examined and appropriate tests, defined in the applicable standard or standards referred to in Article 5(2) or equivalent tests are carried out to check the conformity of the product with the requirements of the corresponding Directive. In the event of one or more samples of the products examined not conforming, the notified body must take the appropriate measures.

Module D: Production quality assurance

1. This module describes the procedure whereby the manufacturer who satisfies the obligations of section 2 ensures and declares that the appliances concerned are in conformity with the type as described in the EC type-examination certificate and satisfy the requirements of this Directive. The manufacturer affixes the CE mark to each appliance and draws up a written declaration of conformity. The CE mark is accompanied by the identification symbol of the notified body responsible for the checks referred to in section 4.

2. The manufacturer must operate an approved quality system for production, final appliance inspection and testing as specified in section 3. He is subject to the checks referred to in section 4.

3. Quality system

3.1. The manufacturer lodges an application for assessment of his quality system with a notified body of his choice, for the appliances concerned.

The application must include:
- all relevant information for the appliance category envisaged,
- the documents concerning the quality system,
- the technical documents pertaining to the approved type and a copy of the EC type-examination certificate.

3.2. The quality system must ensure conformity of appliances with the type as described in the EC type-examination certificate and with the requirements of this Directive that apply to them. All the elements, requirements and provisions adopted by the manufacturer must be documented in a systematic and orderly manner in the form of written policies, procedures and instructions. The quality system documents must permit a consistent interpretation of the quality programmes, plans, manuals and quality records.

It must contain in particular an adequate description of:
- the quality objectives and the organizational structure, responsibilities and powers of the management with regard to appliance quality,
- the manufacturing, quality control and quality assurance techniques, processes and systematic actions that will be used,
- the examinations and tests that will be carried out before, during and after manufacture, and the frequency with which they will be carried out,
- the quality records, such as inspection reports and test data, calibration data, qualification reports of the personnel concerned, etc.,
- the means of monitoring the achievement of the required appliance quality and the effective operation of the quality system.
3.3. The notified body must assess the quality system to determine whether it satisfies the requirements referred to in section 3.2. It must presume conformity with those requirements in respect of quality systems that implement the relevant harmonized standard. The auditing team must have at least one member with experience of assessing the relevant product technology. The assessment procedure includes an inspection visit to the manufacturer's premises.

The decision is notified to the manufacturer. The notification must contain the conclusions of the examination and the duly substantiated assessment decision.

3.4. The manufacturer must undertake to fulfil the obligations arising out of the quality system as approved and maintain it at an adequate and efficient level.

The manufacturer or his authorized representative must keep the notified body that has approved the quality system informed of any proposed change in the quality system.

The notified body must assess the changes proposed and decide whether the altered quality system will still satisfy the requirements referred to in 3.2 or whether reassessment is required.

It must notify the manufacturer of its decision. The notification must contain the conclusions of the examination and the substantiated assessment decision.

4. Monitoring under the responsibility of the notified body

4.1. The purpose of monitoring is to make sure that the manufacturer duly fulfils the obligations arising out of the approved quality system.

4.2. The manufacturer must allow the notified body access for inspection purposes to the manufacturing, inspection, testing and storage premises and provide it with all necessary information, in particular:

— the quality system documents,
— the quality records, such as inspection reports and test data, calibration data, qualification reports of the personnel concerned, etc.

4.3. The notified body must periodically carry out audits to make sure that the manufacturer maintains and applies the quality system and provides an audit report to the manufacturer.

4.4. Additionally the notified body may pay unannounced visits to the manufacturer. During such visits the notified body may carry out tests or have them carried out to verify that the quality system is functioning correctly; if necessary, the notified body must provide the manufacturer with a visit report and, if a test has taken place, with a test report.

5. The manufacturer must, for a period of at least 10 years after the last date of manufacture of the product, keep at the disposal of the national authorities:

— the document referred to in the second indent of 3.1,
— the updating referred to in the second paragraph of 3.4,
— the decisions and reports from the notified body which are referred to in the final paragraph of 3.4, and in 4.3 and 4.4.

6. Each notified body must give the other notified bodies the relevant information concerning the quality system approvals issued and withdrawn.

Module E: Product quality assurance

1. This module describes the procedure whereby the manufacturer who satisfies the obligations of section 2 ensures and declares that the boilers and appliances are in conformity with the type as described in the EC type-examination certificate. The manufacturer must affix the CE mark to each boiler and appliance and draw up a written declaration of conformity. The CE mark must be accompanied by the identification symbol of the notified body responsible for the checks referred to in section 4.

2. The manufacturer must operate an approved quality system for final boiler and appliance inspection and testing as specified in section 3. He must be subject to the checks referred to in section 4.

3. Quality system

3.1. The manufacturer lodges an application with a notified body of this choice for the assessment of the quality system for his boilers and appliances.

The application must include:

— all relevant information for the boiler or appliance category envisaged,
— the quality system's documentation,
— the technical documents pertaining to the approved type and a copy of the EC type-examination certificate.
3.2. Under the quality system, each boiler or appliance is examined and appropriate tests as defined in the relevant standard(s) referred to in Article 5 or equivalent tests are carried out in order to verify its conformity with the relevant requirements of the Directive. All the elements, requirements and provisions adopted by the manufacturer must be documented in a systematic and orderly manner in the form of written policies, procedures and instructions. This quality system documentation must enable the quality programmes, plans, manuals and records to be interpreted in a uniform manner.

It must in particular contain an adequate description of:
- the quality objectives and the organizational structure, responsibilities and powers of the management with regard to product quality,
- the examination and tests that will be carried out after manufacture,
- the means of monitoring the effective operation of the quality system,
- quality records, such as inspection reports and test data, calibration data, qualification reports of the personnel concerned, etc.

3.3. The notified body must assess the quality system to determine whether it satisfies the requirements referred to in 3.2. It must presume conformity with these requirements in respect of quality systems that implement the relevant harmonized standard.

The auditing team must have at least one member with experience of assessing the relevant product technology. The assessment procedure must include an inspection visit to the manufacturer's premises.

The manufacturer must be notified of the decision. The notification must contain the conclusions of the examination and the substantiated assessment decision.

3.4. The manufacturer must undertake to fulfil the obligations arising out of the quality system as approved and maintain it at an adequate and efficient level.

The manufacturer or his authorized representative must keep the notified body which has approved the quality system informed of any proposed change in the quality system.

The notified body must assess the changes proposed and decide whether the altered quality system will still satisfy the requirements referred to in 3.2 or whether a reassessment is required.

It must notify the manufacturer of its decision. The notification must contain the conclusions of the examination and the substantiated assessment decision.

4. Monitoring under the responsibility of the notified body

4.1. The purpose of monitoring is to make sure that the manufacturer duly fulfils the obligations arising out of the approved quality system.

4.2. The manufacturer must allow the notified body access for inspection purposes to the inspection, testing and storage premises and provide it with all necessary information, in particular:
- the quality system documentation,
- the technical documents,
- the quality records, such as inspection reports and test data, calibration data, qualification reports of the personnel concerned, etc.

4.3. The notified body must periodically carry out audits to ensure that the manufacturer maintains and applies the quality system and must provide an audit report to the manufacturer.

4.4. Additionally, the notified body may pay unannounced visits to the manufacturer. During such visits the notified body may carry out tests or have them carried out to verify that the quality system is functioning correctly; if necessary, the notified body must provide the manufacturer with a visit report and, if a test has been carried out, with a test report.

5. The manufacturer must, for a period of at least 10 years after the last date of manufacture of the boiler or appliance, keep at the disposal of the national authorities:
- the documents referred to in the third indent of 3.1,
- the changes referred to in the second paragraph of 3.4,
- the decisions and reports from the notified body which are referred to in the final paragraph of 3.4, and in 4.3 and 4.4.

6. Each notified body must forward to the other notified bodies the relevant information concerning the quality system approvals issued and withdrawn.
ANNEX V

Minimum criteria to be taken into account by Member States for the notification of bodies

1. The body, its director and the staff responsible for carrying out the verification tests may not be the designer, manufacturer, supplier or installer of appliances which they inspect, nor the authorized representative of any of those parties. They may not become either involved directly or as authorized representatives in the design, construction, marketing or maintenance of such boilers and appliances. This does not preclude the possibility of exchanges of technical information between the manufacturer and the body.

2. The body and its staff must carry out the verification tests with the highest degree of professional integrity and technical competence and must be free from all pressures and inducements, particularly financial, which might influence their judgment of the results of the inspection, especially from persons or groups of persons with an interest in the result of verifications.

3. The body must have at its disposal the necessary staff and possess the necessary facilities to enable it to perform properly the administrative and technical tasks connected with verification; it must also have access to the equipment required for special verification.

4. The staff responsible for inspection must have:
   — sound technical and professional training,
   — satisfactory knowledge of the requirements of the tests they carry out and adequate experience of such tests,
   — the ability to draw up the certificates, records and reports required to authenticate the performance of the tests.

5. The impartiality of inspection staff must be guaranteed. Their remuneration must not depend on the number of tests carried out or on the results of such tests.

6. The body must take out liability insurance unless its liability is assumed by the State in accordance with national law, or the Member State itself is directly responsible for the tests.

7. The staff of the body must be bound to observe professional secrecy (except vis-à-vis the competent administrative authorities of the State in which its activities are carried out) under this Directive or any provision of national law giving effect to it.
