COMMISSION DELEGATED REGULATION (EU) 2016/364
of 1 July 2015

on the classification of the reaction to fire performance of construction products pursuant to Regulation (EU) No 305/2011 of the European Parliament and of the Council

(Text with EEA relevance)

THE EUROPEAN COMMISSION,

Having regard to the Treaty on the Functioning of the European Union,

Whereas:

(1) A system for classifying the performance of construction products with regard to their reaction to fire was adopted by Commission Decision 2000/147/EC (2). It was based on a harmonised solution of assessing this performance and classifying the results of these assessments.

(2) Decision 2000/147/EC provides several classes of reaction to fire performance. In addition, it contains classes F, F_{IL}, F_i and F_{ca}, which are defined as ‘no performance determined’.

(3) In accordance with Article 2(7) of Regulation (EU) No 305/2011, a class means a range of levels, delimited by a minimum and a maximum value of performance. Classes defined as ‘no performance determined’ do not correspond to this definition and thus cannot be incorporated in a classification system under Regulation (EU) No 305/2011.

(4) The use of ‘no performance determined’ in the context of drawing up the declaration of performance is provided in Article 6(3)(b) of Regulation (EU) No 305/2011.

(5) In order to enable the manufacturers to declare lower reaction to fire performance than that covered by classes E, E_{IL}, E_i and E_{ca}, it is necessary to change the classification criteria of classes F, F_{IL}, F_i and F_{ca} accordingly.

(6) It is therefore necessary to replace the classes F, F_{IL}, F_i and F_{ca} provided in Decision 2000/147/EC with new classes for products not reaching at least the reaction to fire performance under the classes E, E_{IL}, E_i and E_{ca}.

(7) Decision 2000/147/EC has been amended several times and further amendments to that Decision are necessary. In the interests of clarity and rationality that decision should therefore be repealed and replaced,

HAS ADOPTED THIS REGULATION:

Article 1

When the intended use of a construction product is such that the product may contribute to the generation and spread of fire and smoke within the room or area of origin or beyond, the performance of the product in relation to its reaction to fire shall be classified in accordance with the classification system set out in the Annex.

(1) OJ L 88, 4.4.2011, p. 5.
**Article 2**

Decision 2000/147/EC is repealed.

References to the repealed Decision shall be construed as references to this Regulation.

**Article 3**

This Regulation shall enter into force on the twentieth day following that of its publication in the *Official Journal of the European Union*.

This Regulation shall be binding in its entirety and directly applicable in all Member States.

Done at Brussels, 1 July 2015.

For the Commission

The President

Jean-Claude JUNCKER
ANNEX

Classes of reaction to fire performance

1.1. For the purposes of Tables 1 to 4 the following symbols (1) apply:

(1) 'ΔΤ' — temperature rise;
(2) 'Δm' — mass loss;
(3) 't' — duration of flaming;
(4) 'PCS' — gross calorific potential;
(5) 'LFS' — lateral flame spread;
(6) 'SMOGRA' — smoke growth rate.

1.2. For the purposes of Tables 1, 2 and 3 the following symbols (1) apply:

(1) 'FIGRA' — fire growth rate;
(2) 'THR' — total heat release;
(3) 'TSP' — total smoke production;
(4) 'Fs' — flame spread.

1.3. For the purposes of Table 4 the following symbols and test parameters apply:

(1) 'HRR_{30}', kW — heat release rate averaged by a 30-s sliding average;
(2) 'SPR_{60}', m²/s — smoke production rate averaged by a 60-s sliding average;
(3) 'Peak HRR, kW' — maximum of HRR_{30} between test start and end of test, excluded contribution from ignition source;
(4) 'Peak SPR, m²/s' — maximum of SPR_{60} between test start and end of test;
(5) 'THR_{1200}', MJ — total heat release (HRR_{30}) from test start until end of test, excluded contribution from ignition source;
(6) 'TSP_{1200}', m² — total smoke production (HRR_{30}) from test start until end of test;
(7) 'FIGRA, W/s' — fire growth rate index defined as the highest value of the quotient between HRR_{30} excluding the contribution of ignition source and time. Threshold values HRR_{30} = 3 kW and THR = 0.4 MJ;
(8) 'Fs' — flame spread (damaged length);
(9) 'H' — flame spread.

2. For the purposes of Tables 1 to 4 the following definitions apply:

(1) 'material' means a single basic substance or uniformly dispersed mixture of substances;
(2) 'homogeneous product' means a product consisting of a single material, having uniform density and composition throughout the product;
(3) 'non-homogeneous product' means a product that does not satisfy the requirements of a homogeneous product and that is composed of one or more components, substantial and/or non-substantial;

(1) The characteristics are defined with respect to the appropriate test method.
(4) ‘substantial component’ means a material that constitutes a significant part of a non-homogeneous product; a layer with a mass per unit area ≥ 1,0 kg/m² or a thickness ≥ 1,0 mm is considered to be a substantial component;

(5) ‘non-substantial component’ means a material that does not constitute a significant part of a non-homogeneous product; a layer with a mass per unit area < 1,0 kg/m² and a thickness < 1,0 mm is considered to be a non-substantial component;

(6) ‘internal non-substantial component’ means a non-substantial component that is covered on both sides by at least one substantial component;

(7) ‘external non-substantial component’ means a non-substantial component that is not covered on one side by a substantial component.

Two or more non-substantial layers that are adjacent to each other, where there are no substantial components in between the layers, shall be considered as one non-substantial component and shall, therefore, be classified in accordance with the criteria for a layer that is a non-substantial component.

</table>

(1) For homogeneous products and substantial components of non-homogeneous products.
(2) For any external non-substantial component of non-homogeneous products.
(2a) Alternatively, any external non-substantial component having a $PCS \leq 2,0 \text{ MJm}^{-2}$, provided that the product satisfies the following criteria of EN 13823(SBI): FIGRA $\leq 20 \text{ Ws}^{-1}$; and $LFS < \text{edge of specimen}$; and $THR_{600} \leq 15 \text{ MJ}$; and $s1$; and $d0$.
(3) For any internal non-substantial component of non-homogeneous products.
(4) For the product as a whole.
(5) $s1 = \text{SMOGRA} \leq 30 \text{ m}^2\text{s}^{-2}$ and $\text{TSP}_{600} \leq 50 \text{ m}^2$; $s2 = \text{SMOGRA} \leq 180 \text{ m}^2\text{s}^{-2}$ and $\text{TSP}_{600} \leq 200 \text{ m}^2$; $s3 = \text{not } s1 \text{ or } s2$.
(6) $d0 = \text{No flaming droplets/particles in EN 13823 (SBI) within 600s}$; $d1 = \text{No flaming droplets/particles persisting longer than 10s in EN 13823 (SBI) within 600s}$; $d2 = \text{not } d0 \text{ or } d1$; Ignition of the paper in EN ISO 11925-2 results in a $d2$ classification.
(7) No ignition of the paper = no additional classification; Ignition of the paper = $d2$ classification.
(8) Under conditions of surface flame attack and, if appropriate to the intended use of the product, edge flame attack.

(1) For homogeneous products and substantial components of non-homogeneous products.
(2) For any external non-substantial component of non-homogeneous products.
(3) For any internal non-substantial component of non-homogeneous products.
(4) For the product as a whole.
(5) Test duration = 30 minutes.
(6) Critical flux is defined as the radiant flux at which the flame extinguishes or the radiant flux after a test period of 30 minutes, whichever is the lower (i.e. the flux corresponding with the furthest extent of spread of flame).
(7) s₁ = Smoke ≤ 750 %; min; s₂ = not s₁.
(8) Under conditions of surface flame attack and, if appropriate to the intended use of the product, edge flame attack.
