## COMMISSION REGULATION (EU) No 487/2013

of 8 May 2013

**amending, for the purposes of its adaptation to technical and scientific progress, Regulation (EC) No 1272/2008 of the European Parliament and of the Council on classification, labelling and packaging of substances and mixtures**

(Text with EEA relevance)

THE EUROPEAN COMMISSION,

Having regard to the Treaty on the Functioning of the European Union,

Having regard to Regulation (EC) No 1272/2008 of the European Parliament and of the Council of 16 December 2008 on classification, labelling and packaging of substances and mixtures, amending and repealing Directives 67/548/EEC and 1999/45/EC, and amending Regulation (EC) No 1907/2006 <sup>(1)</sup>, and in particular Article 53 thereof,

Whereas:

(1) Regulation (EC) No 1272/2008 harmonises the provisions and criteria for the classification and labelling of substances, mixtures and certain specific articles within the Union.

(2) That Regulation takes into account the Globally Harmonised System of Classification and Labelling of Chemicals (hereinafter 'GHS') of the United Nations (UN).

(3) The classification criteria and labelling rules of the GHS are periodically reviewed at UN level. The fourth revised edition of the GHS results from changes adopted in December 2010 by the United Nations Committee of Experts on the Transport of Dangerous Goods and on the Globally Harmonised System of Classification and Labelling of Chemicals. It contains amendments concerning, inter alia, new hazard categories for chemically unstable gases and non-flammable aerosols

and further rationalisation of precautionary statements. It is therefore necessary to adapt the technical provisions and criteria in the Annexes to Regulation (EC) No 1272/2008 to the fourth revised edition of the GHS.

(4) The GHS allows authorities to adopt labelling derogations for substances or mixtures classified as corrosive to metals but not corrosive to skin and/or eyes. It also allows the possibility to omit certain label elements from the packaging where the volume of the substance or mixture is below a certain amount. Provisions should be included to implement those measures at the Union level.

(5) The terminology of different provisions in the Annexes and certain technical criteria should also be amended to facilitate implementation by operators and enforcement authorities, to improve consistency of the legal text and to enhance clarity.

(6) To ensure that suppliers of substances can adapt to the new classification, labelling and packaging provisions introduced by this Regulation, a transitional period should be provided and the application of this Regulation should be deferred. This should allow for the possibility to apply the provisions laid down in this Regulation on a voluntary basis before the transitional period is over.

(7) The measures provided for in this Regulation are in accordance with the opinion of the Committee established under Article 133 of Regulation (EC) No 1907/2006 of the European Parliament and of the Council <sup>(2)</sup>,

<sup>(1)</sup> OJ L 353, 31.12.2008, p. 1.

2.2. **Flammable gases (including chemically unstable gases)**

2.2.1. **Definitions**

2.2.1.1. Flammable gas means a gas or gas mixture having a flammable range with air at 20 °C and a standard pressure of 101,3 kPa.

2.2.1.2. A chemically unstable gas means a flammable gas that is able to react explosively even in the absence of air or oxygen.

2.2.2. **Classification criteria**

2.2.2.1. A flammable gas shall be classified in this class in accordance with Table 2.2.1:

Table 2.2.1

**Criteria for flammable gases**

Category	Criteria
1	Gases, which at 20 °C and a standard pressure of 101,3 kPa: (a) are ignitable when in a mixture of 13 % or less by volume in air; or (b) have a flammable range with air of at least 12 percentage points regardless of the lower flammable limit.
2	Gases, other than those of Category 1, which, at 20 °C and a standard pressure of 101,3 kPa, have a flammable range while mixed in air.

Note:

Aerosols shall not be classified as flammable gases; see section 2.3.

2.2.2.2. A flammable gas that is also chemically unstable shall additionally be classified in one of the two categories for chemically unstable gases using the methods described in Part III of the UN RTDG, Manual of Tests and Criteria according to the following table:

Table 2.2.2

**Criteria for chemically unstable gases**

Category	Criteria
A	Flammable gases which are chemically unstable at 20 °C and a standard pressure of 101,3 kPa

The classification procedure is set out in the following decision logic (see Figures 2.2.1 to 2.2.2).

Figure 2.2.1

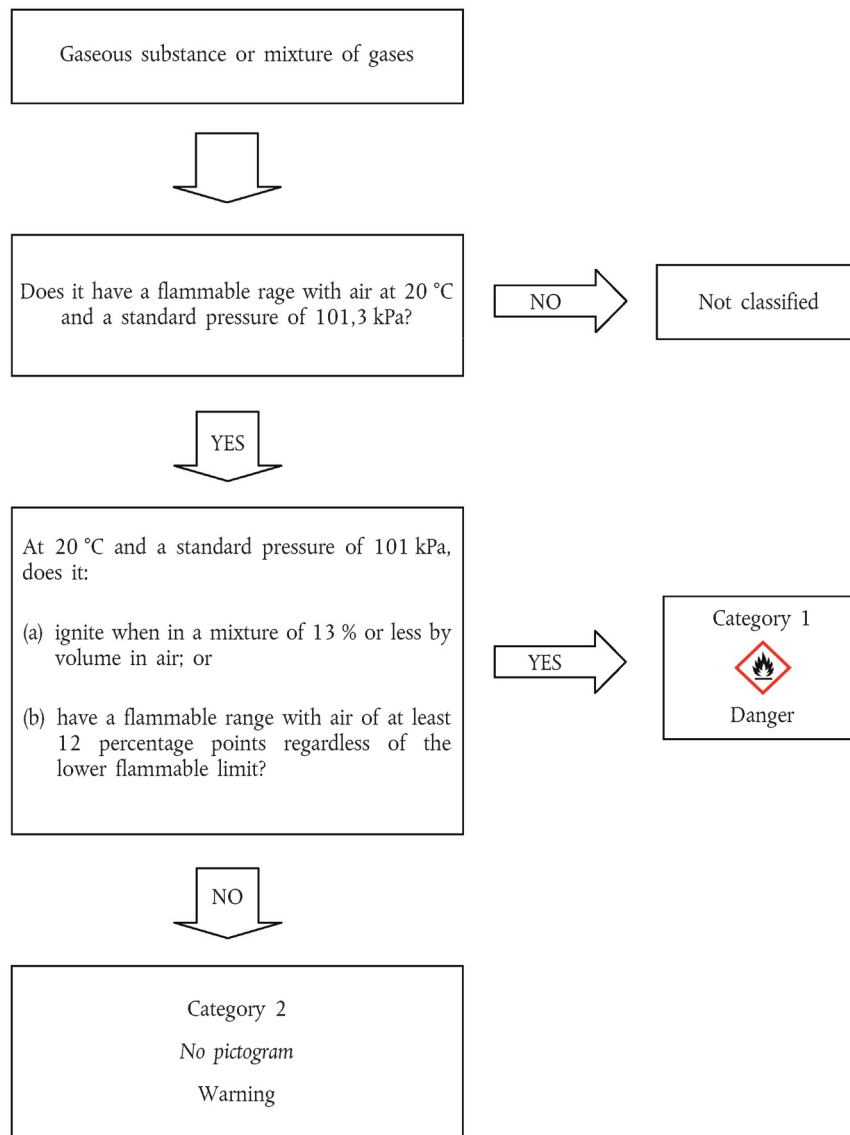

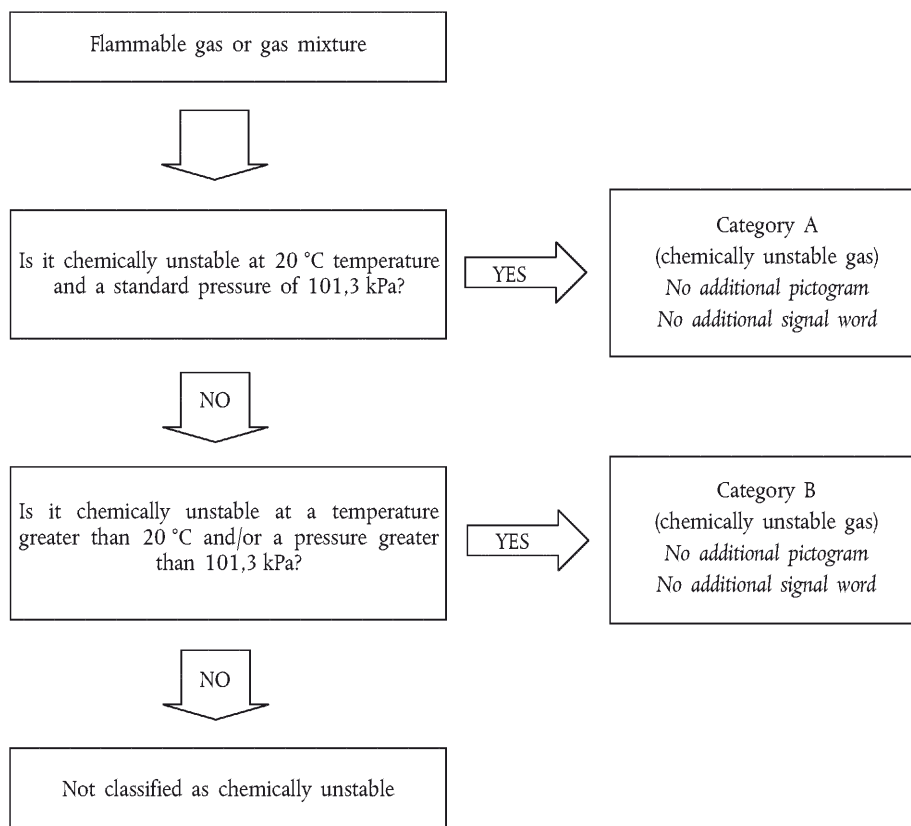

**Flammable gases**

Figure 2.2.2

**Chemically unstable gases****2.2.4. Additional Classification Considerations**

- 2.2.4.1. Flammability shall be determined by tests or, for mixtures where there are sufficient data available, by calculation in accordance with the methods adopted by ISO (see ISO 10156 as amended, Gases and gas mixtures — Determination of fire potential and oxidising ability for the selection of cylinder valve outlet). Where insufficient data are available to use these methods, test method EN 1839 as amended (Determination of explosion limits of gases and vapours) may be used.
- 2.2.4.2. Chemical instability shall be determined in accordance with the method described in Part III of the UN RTDG, Manual of Tests and Criteria. If the calculations in accordance with ISO 10156 as amended show that a gas mixture is not flammable it is not necessary to carry out the tests for determining chemical instability for classification purposes.

**2.3. Aerosols****2.3.1. Definitions**

Aerosols, this means aerosol dispensers, are any non-refillable receptacles made of metal, glass or plastics and containing a gas compressed, liquefied or dissolved under pressure, with or without a liquid, paste or powder, and fitted with a release device allowing the contents to be ejected as solid or liquid particles in suspension in a gas, as a foam, paste or powder or in a liquid state or in a gaseous state.

**2.3.2. Classification criteria**

- 2.3.2.1. Aerosols shall be considered for classification as flammable in accordance with section 2.3.2.2 if they contain any component which is classified as flammable according to the following criteria set out in this Part:

- Liquids with a flash point  $\leq 93$  °C, which includes Flammable Liquids according to section 2.6;
- Flammable gases (see section 2.2);
- Flammable solids (see section 2.7).

*Note 1:*

Flammable components do not cover pyrophoric, self-heating or water-reactive substances and mixtures because such components are never used as aerosol contents.

*Note 2:*

Aerosols do not fall additionally within the scope of sections 2.2 (flammable gases), 2.5 (gases under pressure), 2.6 (flammable liquids) and 2.7 (flammable solids). Depending on their contents, aerosols may however fall within the scope of other hazard classes, including their labelling elements.

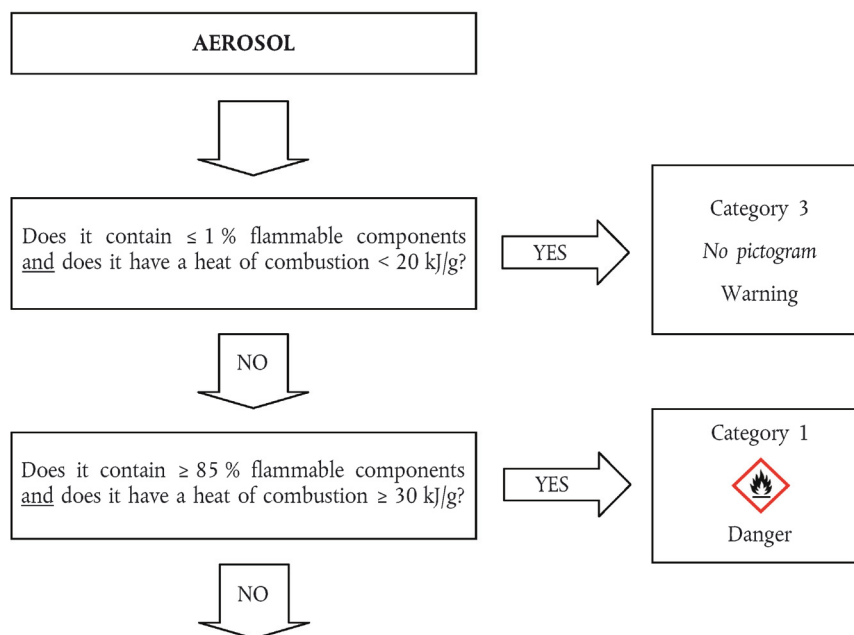

- 2.3.2.2. An aerosol shall be classified in one of the three categories for this Class on the basis of its components, of its chemical heat of combustion and, if applicable, of the results of the foam test (for foam aerosols) and of the ignition distance test and enclosed space test (for spray aerosols) in accordance with Figures 2.3.1(a) to 2.3.1(c) of this Annex and subsections 31.4, 31.5 and 31.6 of Part III of the UN RTDG, Manual of Tests and Criteria. Aerosols which do not meet the criteria for inclusion in Category 1 or Category 2 shall be classified in Category 3.

*Note:*

Aerosols containing more than 1 % flammable components or with a heat of combustion of at least 20 kJ/g, which are not submitted to the flammability classification procedures in this section shall be classified as aerosols, Category 1.

#### 2.3.4. **Additional Classification Considerations**

- 2.3.4.1. The chemical heat of combustion ( $\Delta H_c$ ), in kilojoules per gram (kJ/g), is the product of the theoretical heat of combustion ( $\Delta H_{c,comb}$ ), and a combustion efficiency, usually less than 1,0 (a typical combustion efficiency is 0,95 or 95 %).

For a composite aerosol formulation, the chemical heat of combustion is the summation of the weighted heats of combustion for the individual components, as follows:

$$\Delta H_{c(\text{product})} = \sum_i^n [w_i \% \times \Delta H_{c(i)}]$$

where:

$\Delta H_c$  = chemical heat of combustion (kJ/g);

$w_i$  % = mass fraction of component i in the product;

$\Delta H_{c(i)}$  = specific heat of combustion (kJ/g) of component i in the product.

The chemical heats of combustion can be found in the literature, calculated or determined by tests (see ASTM D 240 as amended — Standard Test Methods for Heat of Combustion of Liquid Hydrocarbon Fuels by Bomb Calorimeter, EN/ISO 13943 as amended, 86.1 to 86.3 — Fire safety — Vocabulary, and NFPA 30B as amended — Code for the Manufacture and Storage of Aerosol Products).;

- (9) In section 2.4.2.1, the Note under Table 2.4.1 is replaced by the following:

'Note:

"Gases which cause or contribute to the combustion of other material more than air does" means pure gases or gas mixtures with an oxidising power greater than 23,5 % as determined by a method specified in ISO 10156 as amended.;

- (10) Section 2.4.4 is replaced by the following:

#### '2.4.4. **Additional Classification Considerations**

To classify an oxidising gas, tests or calculation methods as described in ISO 10156 as amended, "Gases and gas mixtures — Determination of fire potential and oxidising ability for the selection of cylinder valve outlet" shall be performed.;

- (11) In section 2.5.1.1, the first paragraph is replaced by the following:

'Gases under pressure are gases which are contained in a receptacle at a pressure of 200 kPa (gauge) or more at 20 °C, or which are liquefied or liquefied and refrigerated.;

(12) Section 2.5.2 is replaced by the following:

2.5.2. **Classification criteria**

2.5.2.1. Gases under pressure shall be classified, according to their physical state when packaged, in one of four groups in accordance with Table 2.5.1:

Table 2.5.1

**Criteria for gases under pressure**

Group	Criteria

Liquefied gas	A gas which, when packaged under pressure, is partially liquid at temperatures above $-50^{\circ}\text{C}$ . A distinction is made between: <ul style="list-style-type: none"> <li>(i) high pressure liquefied gas: a gas with a critical temperature between <math>-50^{\circ}\text{C}</math> and <math>+65^{\circ}\text{C}</math>; and</li> <li>(ii) low pressure liquefied gas: a gas with a critical temperature above <math>+65^{\circ}\text{C}</math>.</li> </ul>
Refrigerated liquefied gas	A gas which when packaged is made partially liquid because of its low temperature.

In the event that a component without any useable information for classification is used in a mixture at a concentration  $\geq 1\%$ , it is concluded that the mixture cannot be attributed a definitive acute toxicity estimate. In this situation the mixture shall be classified based on the known components only, with the additional statement on the label and in the SDS that "x per cent of the mixture consists of component(s) of unknown acute toxicity", taking into account the provisions set out in section 3.1.4.2.
- 3.1.3.6.2.3. If the total concentration of the relevant ingredient(s) with unknown acute toxicity is  $\leq 10\%$  then the formula presented in section 3.1.3.6.1 shall be used. (4) The following section 3.1.4.2 is inserted:

'3.1.4.2. The acute toxicity hazard statements differentiate the hazard based on the route of exposure. Communication of acute toxicity classification should also reflect this differentiation. If a substance or mixture is classified for more than one route of exposure then all relevant classifications should be communicated on the safety data sheet as specified in Annex II to Regulation (EC) No 1907/2006 and the relevant hazard communication elements included on the label as prescribed in section 3.1.3.2. If the statement "x % of the mixture consists of ingredient(s) of unknown acute toxicity" is communicated, as prescribed in section 3.1.3.6.2.2, then, in the information provided in the safety data sheet, it can also be differentiated based on the route of exposure. For example, "x % of the mixture consists of ingredient(s) of unknown acute oral toxicity" and "x % of the mixture consists of ingredient(s) of unknown acute dermal toxicity".';

(5) Section 3.2.3.3.5 is replaced by the following:

'3.2.3.3.5. On occasion, reliable data may show that the skin corrosion/irritation hazard of an ingredient will not be evident when present at a level at or above the generic concentration limits mentioned in Tables 3.2.3 and 3.2.4 in section 3.2.3.3.6. In these cases the mixture shall be classified according to that data (see also Articles 10 and 11). On other occasions, when it is expected that the skin corrosion/irritation hazard of an ingredient is not evident when present at a level at or above the generic concentration limits mentioned in Tables 3.2.3 and 3.2.4, testing of the mixture shall be considered. In those cases the tiered weight of evidence strategy shall be applied, as set out in section 3.2.2.5.';

'3.3.3.3.5. On occasion, reliable data may show that the reversible/irreversible eye effects of an ingredient will not be evident when present at a level at or above the generic concentration limits mentioned in Tables 3.3.3 and 3.3.4 in section 3.3.3.3.6. In these cases the mixture shall be classified according to those data. On other occasions, when it is expected that the skin corrosion/irritation hazards or the reversible/irreversible eye effects of an ingredient will not be evident when present at a level at or above the generic concentration limits mentioned in Tables 3.3.3 and 3.3.4, testing of the mixture shall be considered. Conversely, a specific profile of toxicity may be seen in animal studies occurring at or above a guidance value, such as ≥ 100 mg/kg bw/day by the oral route, and in addition there is supplementary information from other sources, such as other long-term administration studies, or human case experience, which supports a conclusion that, in view of the weight of evidence, classification is the prudent action to take.';
