160	Plage de ratio prêt sur valeur indexé		La plage de ratio prêt sur valeur indexé (ILTV) correspond au rapport entre le montant actuel du prêt et la valeur actuelle du bien hypothéqué. Il convient de calculer cette plage avec prudence et de respecter au moins les caractéristiques suivantes: a) Montant total du prêt: encours du prêt hypothécaire auquel s'ajoute éventuellement la part engagée non tirée du prêt hypothécaire (après application du facteur de conversion de crédit correspondant). Le montant du prêt devrait être calculé brut de tous ajustements pour risque de crédit spécifique et comprendre tous les autres prêts (notamment ceux qui sont accordés par d'autres établissements financiers et qui sont connus de l'établissement) garantis par des hypothèques de rang égal ou supérieur à celle qui garantit le prêt, portant sur le même bien résidentiel. Si les informations disponibles ne sont pas suffisantes pour s'assurer du rang des autres hypothèques, l'établissement supposera que ces hypothèques sont de rang égal à celle qui garantit le prêt.

Colonne		Référence juridique	Instructions
			b) Valeur du bien: la valeur du bien correspond à la valorisation du bien réalisée de manière indépendante à un moment donné (le plus souvent à l'initiation) et est convertie en valeur actuelle à l'aide d'un indice des prix de l'immobilier. La valorisation doit être effectuée de manière indépendante par des experts répondant à des exigences spécifiques de qualification. Les exigences de qualification et les normes minimales d'estimation doivent remplir les conditions suivantes: — le bien est estimé individuellement et est valorisé de manière prudente (p. ex. en excluant les attentes d'appréciation future du prix et en prenant en compte l'éventualité que le prix actuel du bien se situe au-dessus d'un niveau qui peut être maintenu tout au long de la durée du prêt, notamment dans le cas d'une bulle immobilière); — si une valeur de marché peut être déterminée, la valorisation n'est pas supérieure à la valeur de marché; — la valorisation est étayée par une documentation adéquate. Les établissements sont tenus de consigner leurs calculs par écrit et de fournir les pièces correspondantes à leur autorité compétente sur demande. Les catégories d'ILTV sont les suivantes: a) < = 25 %; b) > 25 % <= 50 %; c) > 50 % <= 75 %; d) > 75 % <= 100 %; e) > 100 % <= 125 %; f) < = 125 %; g) Sans objet.»

PD* est la plus petite estimation de PD pour laquelle le test binomial unilatéral (basé sur une approximation normale de la distribution binomiale avec un niveau de confiance de 97,5 %) serait réussi. PD* = min PD* tel que: $PD^* + \Phi^{-1}(q) \cdot \sqrt{\frac{PD^* \cdot (1 - PD^*)}{n}} > DR_{1y}$ avec: PD* = la probabilité de défaut pour l'échelon; φ^{-1} = la réciproque de la fonction de distribution normale centrée réduite; q = le niveau de confiance; DR_{1y} = le taux de défaut pondéré selon le cas de la dernière année pour l'échelon; n = le nombre de débiteurs non en défaut au début de la période. Un établissement utilisant une PD continue détermine en premier lieu la PD* pour la PD moyenne de chaque catégorie de notation, puis applique à chaque catégorie la même déviation relative entre PD et PD* au niveau de la contrepartie que pour la PD et la PD* moyennes au niveau de l'échelon. Si l'interdiction de prendre en compte la compensation entre les échelons donne lieu à une situation où, pour un échelon donné, la PD* est inférieure à la PD, c'est la note de la PD qui est utilisée pour cet échelon dans le calcul du montant d'exposition pondéré.
240	Actifs pondérés en fonction du risque (RWA)**		Les établissements calculent et déclarent les actifs pondérés en fonction du risque (RWA)** pour les portefeuilles Entreprises, Entreprises — PME, Clientèle de détail — PME et Clientèle de détail — Expositions garanties par des biens immobiliers pour l'ensemble du portefeuille et au niveau du pays. Ces portefeuilles sont définis dans le modèle 103 figurant à l'annexe I du présent règlement d'exécution et sont identifiés par les codes suivants: a) CORP0007;

Indiquer le montant d'exposition pondéré après application du facteur supplétif en faveur des PME qui résulterait de l'application de la PD** au lieu de la PD d'origine au niveau de l'échelon. Il ne faut tenir compte d'aucune compensation entre les échelons. PD** est la plus petite estimation de PD pour laquelle le test binomial unilatéral (basé sur une approximation normale de la distribution binomiale avec un niveau de confiance de 97,5 %) serait réussi. L'échelon correspond au calcul suivant. PD** = min PD** tel que: $$PD^{**} + \Phi^{-1}(q) \cdot \sqrt{\frac{PD^{**} \cdot (1 - PD^{**})}{n}} > DR_{5y}$$ avec: PD** = la probabilité de défaut pour l'échelon; φ^{-1} = la réciproque de la fonction de distribution normale centrée réduite; q = le niveau de confiance; DR_{5y} = le taux de défaut pondéré selon le cas des 5 dernières années pour l'échelon, calculé comme la moyenne des cinq taux de défaut annuels; n = le nombre de débiteurs non en défaut au début de la période.

INSTRUCTIONS COMMUNES

L'établissement applique toutes les instructions suivantes:

a) sauf indication explicite contraire dans la description du portefeuille, toutes les positions sont comptabilisées au 13 octobre 2016. Une fois les positions comptabilisées, chaque portefeuille mature pour la durée de l'exercice d'analyse comparative. En outre, les calculs sont réalisés en partant du principe que l'établissement n'engagera aucune action de gestion du portefeuille pendant toute la durée de l'exercice d'analyse comparative. Sauf indication explicite contraire dans les spécifications d'un portefeuille donné, le prix d'exercice des positions d'option est déterminé par rapport au prix du sous-jacent tel qu'observé à la clôture du marché le 13 octobre 2016;

b) aux fins de la validation de l'exercice de pré-benchmarking, la valorisation de chaque portefeuille doit être soumise à l'autorité compétente de l'établissement au plus tard le [date d'entrée en vigueur]. Par valorisation de marché initiale (VMI), on entend la somme de la valeur de marché lors de la journée de comptabilisation et du bilan non réalisé [c.-à-d. les profits ou les pertes accumulés mais pas encore réalisés ou qui seraient réalisés si la position était liquidée] entre la journée de comptabilisation et le jour et l'heure de la valorisation. Dès lors, on entend par VMI la valeur de marché à la date et à l'heure de la valorisation. La valorisation est effectuée le 27 octobre 2016, à 17h30 CET (16h30 GMT);

c) les risques des positions sont calculés compte non tenu des coûts de financement;

d) dans la mesure du possible, le risque de crédit de la contrepartie est exclu de l'évaluation des risques des portefeuilles;

e) la VaR 10 jours 99 % est calculée quotidiennement. La valeur en risque en situation de tensions (sVaR) et les exigences de fonds propres pour risques supplémentaires (incremental risk charge, IRC) peuvent être calculées hebdomadairement. La sVaR et l'IRC sont basés sur les prix de fin de journée de chaque vendredi de la période couverte par l'exercice d'analyse comparative;

f) pour chaque portefeuille, les résultats sont fournis dans la monnaie de base du portefeuille, comme exigé dans les tableaux suivants;

g) pour les transactions comprenant des positions longues sur des contrats d'échange sur risque de crédit (CDS), il est supposé qu'une commission d'entrée immédiate est payée pour entrer dans la position, conformément aux conventions du marché. Il est supposé que les dates d'échéance de toutes les positions sur CDS, dans le cadre de l'exercice, correspondent aux dates de cessation trimestrielles conventionnelles;

h) les spécifications supplémentaires nécessaires pour réaliser les calculs de prix requis pour les positions sur CDS sont cohérentes avec les pratiques communément admises et les conventions du marché;

i) la date d'échéance garantissant que la transaction est le plus proche possible de l'échéance spécifiée est utilisée.

j) pour les détails importants de la spécification du produit qui ne sont pas explicitement indiqués dans la présente annexe, les hypothèses retenues, y compris la convention de calcul des jours, et le choix d'un instrument négociable et liquide si cela est autorisé, sont présentées avec les résultats;

k) les abréviations ATM, OTM et ITM se réfèrent à la position relative du prix actuel ou futur d'un actif sous-jacent d'un dérivé par rapport au prix d'exercice de ce dérivé («liquidité»). ATM («at the money») signifie «à parité», OTM («out of the money») signifie «hors du cours», et ITM («in the money») signifie «dans le cours»;

l) toutes les options sont considérées de gré à gré (OTC), sauf indication explicite contraire dans le portefeuille;

m) les conventions de calendrier standard pour les options de gré à gré sont respectées (à savoir, les dates d'expiration correspondent au jour ouvrable suivant un jour non ouvrable). La convention de calendrier pour les options est la suivante: la maturité restante pour une option à *n* mois est de *n* mois. Lorsque des options expirent un jour non ouvrable, les établissements ajustent la date d'expiration par jour ouvrable, conformément aux pratiques habituelles du marché;

n) toutes les options OTC sont considérées comme suit:

— américaines pour les actions et les matières premières à signature unique;

— européennes pour les indices d'actions, le change et les swaptions;

o) pour toutes les options, la prime découlant des calculs de la valeur de marché initiale est exclue, de sorte que les options sont considérées comme étant «*nues*»);

p) s'agissant du portefeuille de négociation en corrélation (CTP), IM correspond aux mesures de risque provenant des calculs des modèles internes pour les portefeuilles de négociation en corrélation, conformément à l'article 377 du règlement (UE) n° 575/2013. Il est indiqué comme mesure du risque de prix total (all price risk, APR) à l'annexe VI du présent règlement d'exécution;

q) pour les positions libellées en devise de référence commune, mais composées d'un ou de plusieurs instruments libellés dans une autre monnaie, la valeur de marché initiale (IMV) est convertie en devise de référence commune au taux de change (FX) au comptant au terme de la journée de comptabilisation (13 octobre 2016). La même devise de référence commune utilisée pour convertir l'IMV est utilisée pour les résultats (profits et pertes), et les mesures de risque et en situation de tensions (VaR, sVaR, IRC, APR), en utilisant le taux de change (FX) correspondant et approprié;

r) lors de la comptabilisation de toutes les positions, les établissements suivent les conventions de marché appropriées, sauf indication contraire. Dans les sections suivantes, «long» signifie «acheter» et «court», «vendre». Pour les positions sur CDS, «long» signifie «acheter une protection» et «court», «vendre une protection», selon la pratique habituelle du marché;

s) lorsqu'un instrument fait l'objet d'une opération sur titre, y compris un rachat par l'émetteur, un défaut ou une opération similaire, les établissements excluent cet instrument du portefeuille avec tout CDS ou toute option lié(e);

t) «on-the-run» se rapportant à une série indicielle signifie la série la plus liquide et négociable de cet indice qui est disponible sur le marché. Les établissements communiquent leur choix de série indicielle avec les résultats corrélés dans les cellules appropriées des modèles;

u) le taux interbancaire offert en euros (EURIBOR) est le taux calculé par le European Money Markets Institute à différentes échéances pour les dépôts interbancaires à terme en euros;

v) le taux interbancaire offert à Londres (LIBOR) est le taux calculé par l'Intercontinental Exchange à différentes échéances pour les dépôts interbancaires à terme dans différentes monnaies.
